1

A CATALYST SYSTEM

The present invention relates to a novel catalyst system, a novel carbonylation reaction medium and a process for the carbonylation of ethylenically unsaturated compounds using a novel catalyst system.

The carbonylation of ethylenically unsaturated compounds using carbon monoxide in the presence of an alcohol or water and a catalyst system comprising a Group VIII metal, eg. palladium, and a phosphine ligand eg. an alkyl phosphine cycloalkyl phosphine, aryl phosphine, pyridyl phosphine or bidentate phosphine, has been described in numerous European patents and patent applications, eg. EP-A-0055875, EP-A-04489472, EP-A-0106379, EP-A-0235864, EP-A-0274795, EP-A-0499329, EP-A-0386833, EP-A-0441447, EP-A-0489472, EP-A-0282142, EP-A-0227160, EP-A-0495547 and EP-A-0495548. In particular, EP-A-0227160, EP-A-0495547 and EP-A-0495548 disclose that bidentate phosphine ligands provide catalyst systems which enable higher reaction rates to be achieved.

WO 96/19434 discloses a bridging group in the form of an optionally substituted aryl moiety, linked to the said phosphorous atoms via available adjacent carbon atoms on the said aryl moiety. Such a ligand is more stable and leads to reaction rates which are significantly higher than those previously disclosed and produces little or no impurities for the carbonylation of ethylene. Each phosphorous atom in the said ligand is also linked to two tertiary carbon atoms.

2

However, conventional metal-catalysed reactions, such as those described in WO 96/19434 tend to suffer from the drawback that the catalyst tends to de-activate over the course of a period of continuous operation as the

5   palladium compound is reduced to palladium metal, this contributing to the economic viability of the process. WO 01/10551 addressed this problem via the use of stabilising compounds such as polymeric dispersants in the reaction medium, thus improving in the recovery of metal which has

10   been lost from the catalyst system.

Although catalyst systems have been developed which exhibit reasonable stability during the carbonylation process and permit relatively high reaction rates to be

15   achieved, there still exists a need for improved catalyst systems. Suitably, the present invention aims to provide an improved catalyst for carbonylating ethylenically unsaturated compounds.

20   J.Mol.Cat.A 204-205 (2003) pgs 295-303 suggests that a relative increase in the ligand concentration, for example by the addition of more ligand, has a detrimental effect on productivity.   Similar results are reported in J.Mol.Cat.A.Chem.   110   (1996)   pgs   13-23   and

25   J.Mol.Cat.A.Chem. 151 (2000) pgs 47-59.

Moreover, WO-A-01/72697 describes a process for the carbonylation of pentenenitrile but teaches that there are disadvantages associated at relatively high acid:palladium

30   ratios. The authors state that the disadvantages occur because high acid concentration conditions are corrosive and more ligand degradation results from quaternisation with the acid and the olefinic compound.

WO-A-01/68583 discloses a process for the carbonylation of ethylenically unsaturated compounds using phosphine-based bidentate ligands. However, this disclosure is directed

5   towards the use of relatively low acid levels, leading to low acid:ligand values. Moreover, the ligand:metal ratios are low. WO-A-03/040159 similarly discloses low acid:ligand and ligand:metal ratios.

10   WO-A-98/45040 discloses catalyst systems comprising palladium compound and bidentate phosphorus ligands. However, acid:ligand ratios of less than 1:1 are taught.

Finally, WO-A-01/72697 discloses a process for the
15   preparation of a 5-cyanovaleric acid by carbonylation of a pentenenitrile. The disclosure points out the disadvantages in using high acid concentrations and teaches towards the use of relatively low acid levels.

20   Hence, an aim of the present invention is to seek to establish a catalyst system wherein the levels of ligand and acid are relatively high, but wherein the disadvantages of the prior art noted hereinbefore are addressed and alleviated, at least to some extent, the
25   aforesaid being one object of the present invention.

According to the present invention there is provided a catalyst system, a process for the carbonylation of an ethylenically unsaturated compound, a reaction medium, and
30   use as set forth in the appended claims.

Preferred features of the invention will be apparent from the dependent claims, and the description which follows.

According to a first aspect, the present invention provides a catalyst system capable of catalysing the carbonylation of an ethylenically unsaturated compound, which system is obtainable by combining:

a) a metal of Group VIB or Group VIIIB or a compound thereof,

b) a bidentate phosphine, arsine, or stibine ligand, preferably a bidentate phosphine ligand, and

c) an acid,

wherein said ligand is present in at least a 2:1 molar excess compared to said metal or said metal in said metal compound, and that said acid is present in at least a 2:1 molar excess compared to said ligand.

Typically, component b) is a bidentate phosphine, arsine, or stibine.

Suitably, all of components a) to c) of the catalyst system can be added in situ to the reaction vessel wherein the carbonylation is to take place. Alternatively, the components a) to c) can be added sequentially in any order to form the catalyst system, or in some specified order, either directly into the vessel or outside the vessel and then added to the vessel. For instance, the acid component c) may first be added to the bidentate ligand component b), to form a protonated ligand, and then the protonated ligand can be added to the metal or compound thereof (component a)) to form the catalyst system. Alternatively, the ligand component b) and metal or compound thereof (component a)) can be mixed to form a

5

chelated metal compound, and the acid (component c)) is then added. Alternatively, any two components can be reacted together to form an intermediate moiety which is then either added to the reaction vessel and the third component added, or is first reacted with the third component and then added to the reaction vessel.

As such, the present invention is directed to a catalyst system wherein the relative molar concentrations of both the bidentate ligand and the acid are at levels in excess of those previously envisaged, leading to surprising and unexpected advantages when using the catalyst system in the carbonylation of ethylenically unsaturated compounds, and the alleviation or at least reduction of at least some of the disadvantages of the prior art systems. In particular, the use of a catalyst system of the present invention leads at least to a more stable system, increased reaction rates, and improved turnover numbers in carbonylation reactions of ethylenically unsaturated compounds.

As stated above, the ligand is present in the catalyst system, or precursor thereto, in such quantity that the ratio of said ligand to the said metal (i.e. component b) to component a)) is at least a 2:1 molar ratio. Preferably, the ratio of said ligand to the said metal is greater than a 2:1 molar ratio, more preferably in the range 2:1 to 1000:1, even more preferably in the range 2.5:1 to 1000:1, yet more preferably in the range 3:1 to 1000:1, even more preferably in the range 5:1 to 750:1, more preferably in the range 7:1 to 1000:1, especially in the range 8:1 to 900:1, still more preferably in the range 10:1 to 500:1, yet still more preferably in the range 20:1

to 400:1, even more preferably in the range 50:1 to 250:1, most preferably in the range in excess of 50:1, for example 51:1 and upwards, more specifically 51:1 to 250:1 or even to 1000:1. Alternatively, the said ratio can be

5 in the range 15:1 to 45:1, preferably 20:1 to 40:1, more preferably 25:1 to 35:1.

As stated above, the acid is present in the catalyst system, or precursor thereto, in such quantity that the

10 ratio of said acid to the said ligand (i.e. component c) to component b)) is at least a 2:1 molar ratio. Preferably, the ratio of said acid to the said ligand is greater than a 2:1 molar ratio, more preferably in the range 2:1 to 100:1, even more preferably in the range 4:1

15 to 100:1, yet more preferably in the range 5:1 to 95:1, still more preferably in the range greater than 5:1 to 95:1, yet more preferably in the range greater than 5:1 to 75:1, more preferably in the range 10:1 to 50:1, even more preferably in the range 20:1 to 40:1, still more

20 preferably in the range greater than 20:1 to 40:1 (e.g. 25:1 to 40:1, or 25:1 to less than 30:1), more preferably in excess of 30:1, suitably with any of the upper limits provided hereinbefore (e.g. 30:1 to 40:1, or 50:1, etc.), or more preferably in excess of 35:1, yet more preferably

25 in excess of 37:1, suitably either with any of the upper limits provided hereinbefore. Each of the ranges in this paragraph can be used in conjunction with each of the ligand to metal ratio ranges disclosed hereinabove, i.e. ratios of component b) to component a).

30

By "acid", we mean an acid or salt thereof, and references to acid should be construed accordingly.

The advantages in working within the ligand to metal, and
acid to ligand ratios, set out above are manifest in that
the stability of the catalyst system is improved, as
evidenced by increases in the turnover number (TON) of the
5   metal. By improving the stability of the catalyst system,
the usage of metal in the carbonylation reaction scheme is
kept to a minimum.

Without wishing to be bound by theory, it is believed that
10   by working within the specific ratio ranges noted herein,
it is surprisingly found that the ligand component of the
catalyst system is protected against inadvertent aerial
oxidation (in instances where there is any ingress of air
into the reaction system), and the overall stability of
15   the catalyst system is improved, thus keeping the usage of
the metal component of the catalyst system to a minimum.
Moreover, the forward reaction rate of the reaction is
surprisingly improved.
In effect, the level of acid should be such that for the
20   particular bidentate ligand employed, the level of acid
should be such that phosphine, arsine or stibine is fully
protonated.   Hence, to show the improved effects, the
level of ligand should be above some minimum level, as
given by the ligand:metal molar ratio, and the level of
25   acid should be above some minimum level with respect to
the level of ligand present to encourage protonation, as
given by the acid:ligand molar ratio.
Preferably, the acid is present in the catalyst system, or
precursor thereto, in such quantity that the molar ratio
30   of said acid to said metal (i.e. component c) to component
a)) is at least 4:1, more preferably from 4:1 to 100000:1,
even more preferably 10:1 to 75000:1, yet more preferably
20:1 to 50000:1, yet still more preferably 25:1 to

8

50000:1, yet still more preferably 30:1 to 50000:1, yet
even more preferably 40:1 to 40000:1, still more
preferably 100:1 to 25000:1, more preferably 120:1 to
25000:1, more preferably 140:1 to 25000:1, yet still more
5   preferably 200:1 to 25000:1, most preferably 550:1 to
20000:1, or greater than 2000:1 to 20000:1.
Alternatively, the said ratio can be in the range 125:1 to
485:1, more preferably 150:1 to 450:1, even more
preferably 175:1 to 425:1, yet even more preferably 200:1
10 to 400:1, most preferably 225:1 to 375:1. Each of these
ranges in this paragraph can be used in conjunction with
each of the ligand to metal ratio ranges disclosed
hereinabove, i.e. ratios of component b) to component a),
and/or each of the acid to ligand ratio ranges disclosed
15 hereinabove, i.e. ratios of component c) to component b).

For the avoidance of any doubt, all of the aforementioned
ratios and ratio ranges apply to all of the ligand
embodiments set out in more detail hereinafter.
20

In one embodiment of the present invention, the bidentate
phosphine ligand is of general formula (I)

25   (I)

wherein:

9
Ar is a bridging group comprising an optionally substituted aryl moiety to which the phosphorus atoms are linked on available adjacent carbon atoms;

5   A and B each independently represent lower alkylene;

K, D, E and Z are substituents of the aryl moiety (Ar) and each independently represent hydrogen, lower alkyl, aryl, Het, halo, cyano, nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$,

10   $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, $C(S)R^{25}R^{26}$, SR^{27}, $C(O)SR^{27}$, or $-J-Q^3(CR^{13}(R^{14})(R^{15})CR^{16}(R^{17})(R^{18})$ where J represents lower alkylene; or two adjacent groups selected from K, Z, D and E together with the carbon atoms of the aryl ring to which they are attached form a further phenyl ring, which is

15   optionally substituted by one or more substituents selected from hydrogen, lower alkyl, halo, cyano, nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, $C(S)R^{25}R^{26}$, SR^{27} or $C(O)SR^{27}$;

R^{13} to R^{18} each independently represent hydrogen, lower

20   alkyl, aryl, or Het, preferably each independently represent lower alkyl, aryl, or Het;

R^{19} to R^{27} each independently represent hydrogen, lower alkyl, aryl or Het;

25   R^1 to R^{12} each independently represent hydrogen, lower alkyl, aryl, or Het, preferably each independently represent lower alkyl, aryl, or Het;

Q^1, Q^2 and Q^3 (when present) each independently represent

30   phosphorous, arsenic or antimony and in the latter two cases references to phosphine or phosphorous above are amended accordingly, with preferably both Q^1 and Q^2

representing phosphorus, more preferably all of Q^1, Q^2 and Q^3 (when present) representing phosphorus.

Suitably, the bidentate phosphines of the invention should preferably be capable of bidentate coordination to the Group VIB or Group VIIIB metal or compound thereof, more preferably to the preferred palladium.

Preferably, when K, D, E or Z represent $-J-Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$, the respective K, D, E or Z is on the aryl carbon adjacent the aryl carbon to which A or B is connected or, if not so adjacent, is adjacent a remaining K, D, E or Z group which itself represents $-J-Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$.

Specific but non-limiting examples of bidentate ligands within this embodiment include the following: 1,2-bis-(di-tert-butylphosphinomethyl)benzene,   1,2-bis-(di-tert-pentylphosphinomethyl)benzene,   1,2-bis-(di-tert-butylphosphinomethyl)naphthalene.   Nevertheless,   the skilled person in the art would appreciate that other bidentate ligands can be envisaged without departing from the scope of the invention.

The term "Ar" or "aryl" when used herein, includes five-to-ten-membered, preferably, six-to-ten membered carbocyclic aromatic groups, such as phenyl and naphthyl, which groups are optionally substituted with, in addition to K, D, E or Z, one or more substituents selected from aryl, lower alkyl (which alkyl group may itself be optionally substituted or terminated as defined below), Het, halo, cyano, nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, SR^{27}, $C(O)SR^{27}$ or $C(S)NR^{25}R^{26}$ wherein R^{19} to R^{27} each independently represent hydrogen, aryl or

lower alkyl (which alkyl group may itself be optionally substituted or terminated as defined below). Furthermore, the aryl moiety may be a fused polycyclic group, e.g. naphthalene, biphenylene or indene.

By the term "a metal of Group VIB or Group VIIIB" we include metals such as Cr, Mo, W, Fe, Co, Ni, Ru, Rh, Os, Ir, Pt and Pd. Preferably, the metals are selected from Ni, Pt and Pd. More preferably, the metal is Pd. For the avoidance of doubt, references to Group VIB or VIIIB metals herein should be taken to include Groups 6, 8, 9 and 10 in the modern periodic table nomenclature.

The term "Het", when used herein, includes four-to-twelve-membered, preferably four-to-ten-membered ring systems, which rings contain one or more heteroatoms selected from nitrogen, oxygen, sulphur and mixtures thereof, and which rings may contain one or more double bonds or be non-aromatic, partly aromatic or wholly aromatic in character. The ring systems may be monocyclic, bicyclic or fused. Each "Het" group identified herein is optionally substituted by one or more substituents selected from halo, cyano, nitro, oxo, lower alkyl (which alkyl group may itself be optionally substituted or terminated as defined below) OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, SR^{27}, $C(O)SR^{27}$ or $C(S)NR^{25}R^{26}$ wherein R^{19} to R^{27} each independently represent hydrogen, aryl or lower alkyl (which alkyl group itself may be optionally substituted or terminated as defined below). The term "Het" thus includes groups such as optionally substituted azetidinyl, pyrrolidinyl, imidazolyl, indolyl, furanyl, oxazolyl, isoxazolyl, oxadiazolyl, thiazolyl, thiadiazolyl,

triazolyl, oxatriazolyl, thiatriazolyl, pyridazinyl, morpholinyl, pyrimidinyl, pyrazinyl, quinolinyl, isoquinolinyl, piperidinyl, pyrazolyl and piperazinyl. Substitution at Het may be at a carbon atom of the Het ring or, where appropriate, at one or more of the heteroatoms.

"Het" groups may also be in the form of an N oxide.

The term "lower alkyl" when used herein, means C_1 to C_{10} alkyl and includes methyl, ethyl, propyl, butyl, pentyl, hexyl and heptyl groups. Unless otherwise specified, alkyl groups may, when there is a sufficient number of carbon atoms, be linear or branched, be saturated or unsaturated, be cyclic, acyclic or part cyclic/acyclic, and/or be substituted or terminated by one or more substituents selected from halo, cyano, nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, SR^{27}, $C(O)SR^{27}$, $C(S)NR^{25}R^{26}$, aryl or Het, wherein R^{19} to R^{27} each independently represent hydrogen, aryl or lower alkyl, and/or be interrupted by one or more oxygen or sulphur atoms, or by silano or dialkylsilcon groups.

Lower alkyl groups or alkyl groups which R^1, R^2, R^3, R^4, R^5, R^6, R^7, R^8, R^9, R^{10}, R^{11}, R^{12}, R^{13}, R^{14}, R^{15}, R^{16}, R^{17}, R^{18}, R^{19}, R^{20}, R^{21}, R^{22}, R^{23}, R^{24}, R^{25}, R^{26}, R^{27}, K, D, E and Z may represent and with which aryl and Het may be substituted, may, when there is a sufficient number of carbon atoms, be linear or branched, be saturated or unsaturated, be cyclic, acyclic or part cyclic/acyclic, and/or be interrupted by one or more of oxygen or sulphur atoms, or by silano or dialkylsilicon groups, and/or be substituted by one or more substituents selected from halo, cyano,

nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, SR^{27}, $C(O)SR^{27}$, $C(S)NR^{25}R^{26}$, aryl or Het wherein R^{19} to R^{27} each independently represent hydrogen, aryl or lower alkyl.

Similarly, the term "lower alkylene" which A, B and J (when present) represent in a compound of formula I, when used herein, includes C_1 to C_{10} groups which are bonded to other moieties at least at two places on the group and is otherwise defined in the same way as "lower alkyl".

Halo groups with which the above-mentioned groups may be substituted or terminated include fluoro, chloro, bromo and iodo.

Where a compound of a formula herein contains an alkenyl group, cis (E) and trans (Z) isomerism may also occur. The present invention includes the individual stereoisomers of the compounds of any of the formulas defined herein and, where appropriate, the individual tautomeric forms thereof, together with mixtures thereof. Separation of diastereoisomers or cis and trans isomers may be achieved by conventional techniques, e.g. by fractional crystallisation, chromatography or H.P.L.C. of a stereoisomeric mixture of a compound one of the formulas or a suitable salt or derivative thereof. An individual enantiomer of a compound of one of the formulas may also be prepared from a corresponding optically pure intermediate or by resolution, such as by H.P.L.C. of the corresponding racemate using a suitable chiral support or by fractional crystallisation of the diastereoisomeric salts formed by reaction of the corresponding racemate

with a suitable optically active acid or base, as appropriate.

All stereoisomers are included within the scope of the process of the invention.

It will be appreciated by those skilled in the art that the compounds of formula I may function as ligands that coordinate with the Group VIB or Group VIIIB metal or compound thereof in the formation of the catalyst system of the invention. Typically, the Group VIB or Group VIIIB metal or compound thereof coordinates to the one or more phosphorous, arsenic and/or antimony atoms of the compound of formula I.

Preferably, R^1 to R^{18} each independently represent lower alkyl or aryl. More preferably, R^1 to R^{18} each independently represent C_1 to C_6 alkyl, C_1-C_6 alkyl phenyl (wherein the phenyl group is optionally substituted as defined herein) or phenyl (wherein the phenyl group is optionally substituted as defined herein). Even more preferably, R^1 to R^{18} each independently represent C_1 to C_6 alkyl, which is optionally substituted as defined herein. Most preferably, R^1 to R^{18} each represent non-substituted C_1 to C_6 alkyl such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl and cyclohexyl.

Alternatively, or additionally, each of the groups R^1 to R^3, R^4 to R^6, R^7 to R^9, R^{10} to R^{12}, R^{13} to R^{15} or R^{16} to R^{18} together independently may form cyclic structures such as 1-norbornyl or 1-norbornadienyl. Further examples of composite groups include cyclic structures formed between

R^1-R^{18}. Alternatively, one or more of the groups may represent a solid phase to which the ligand is attached.

In a particularly preferred embodiment of the present
5   invention R^1, R^4, R^7, R^{10}, R^{13} and R^{16} each represent the same lower alkyl, aryl or Het moiety as defined herein, R^2, R^5, R^8, R^{11}, R^{14} and R^{17} each represent the same lower alkyl, aryl or Het moiety as defined herein, and R^3, R^6, R^9, R^{12}, R^{15} and R^{18} each represent the same lower alkyl,
10   aryl or Het moiety as defined herein. More preferably R^1, R^4, R^7, R^{10}, R^{13} and R^{16} each represent the same C_1-C_6 alkyl, particularly non-substituted C_1-C_6 alkyl, such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl or cyclohexyl; R^2, R^5, R^8, R^{11}, R^{14} and
15   R^{17} each independently represent the same C_1-C_6 alkyl as defined above; and R^3, R^6, R^9, R^{12}, R^{15} and R^{18} each independently represent the same C_1-C_6 alkyl as defined above. For example: R^1, R^4, R^7, R^{10}, R^{13} and R^{16} each represent methyl; R^2, R^5, R^8, R^{11}, R^{14} and R^{17} each represent
20   ethyl; and, R^3, R^6, R^9, R^{12}, R^{15} and R^{18} each represent n-butyl or n-pentyl.

In an especially preferred embodiment of the present invention each R^1 to R^{18} group represents the same lower
25   alkyl, aryl, or Het moiety as defined herein. Preferably, each R^1 to R^{18} represents the same C_1 to C_6 alkyl group, particularly non-substituted C_1-C_6 alkyl, such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl and cyclohexyl. Most preferably, each
30   R^1 to R^{18} represents methyl.

In the compound of formula I, preferably each Q^1, Q^2 and Q^3 (when present) are the same. Most preferably, each Q^1, Q^2 and Q^3 (when present) represents phosphorous.

5   Preferably, in the compound of formula I, A, B and J (when present) each independently represent C_1 to C_6 alkylene which is optionally substituted as defined herein, for example with lower alkyl groups. Preferably, the lower alkylene groups which A, B and J (when present) represent

10   are non-substituted. A particular preferred lower alkylene which A, B and J may independently represent is $-CH_2-$ or $-C_2H_4-$. Most preferably, each of A, B and J (when present) represent the same lower alkylene as defined herein, particularly $-CH_2-$.

15

Preferably, in the compound of formula I when K, D, E or Z does not represent $-J-Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$, K, D, E or Z represents hydrogen, lower alkyl, phenyl or lower alkylphenyl. More preferably, K, D, E or Z represent

20   hydrogen, phenyl, C_1-C_6 alkylphenyl or C_1-C_6 alkyl, such as methyl, ethyl, propyl, butyl, pentyl and hexyl. Most preferably, K, D, E or Z represents hydrogen.

Preferably, in the compound of formula I when K, D, E and

25   Z together with the carbon atoms of the aryl ring to which they are attached do not form a phenyl ring, K, D, E and Z each independently represent hydrogen, lower alkyl, phenyl or lower alkylphenyl. More preferably, K, D, E and Z each independently represent hydrogen, phenyl, C_1-C_6

30   alkylphenyl or C_1-C_6 alkyl, such as methyl, ethyl, propyl, butyl, pentyl and hexyl. Even more preferably, K, D, E and Z represent the same substituent. Most preferably, they represent hydrogen.

Preferably, in the compound of formula I when K, D, E or Z does not represent $-J-Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$ and K, D, E and Z together with the carbon atoms of the aryl ring to which they are attached do not form a phenyl ring, each of K, D, E and Z represent the same group selected from hydrogen, lower alkyl, aryl, or Het as defined herein; particularly hydrogen or C_1-C_6 alkyl (more particularly unsubstituted C_1-C_6 alkyl), especially hydrogen.

Preferably, in the compound of formula I when two of K, D, E and Z together with the carbon atoms of the aryl ring to which they are attached form a phenyl ring, then the phenyl ring is optionally substituted with one or more substituents selected from aryl, lower alkyl (which alkyl group may itself be optionally substituted or terminated as defined below), Het, halo, cyano, nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, SR^{27}, $C(O)SR^{27}$ or $C(S)NR^{25}R^{26}$ wherein R^{19} to R^{27} each independently represent hydrogen or lower alkyl (which alkyl group may itself be optionally substituted or terminated as defined herein). More preferably, the phenyl ring is not substituted by any substituents i.e. it bears hydrogen atoms only.

Preferred compounds of formula I include those wherein:

A and B each independently represent unsubstituted C_1 to C_6 alkylene;

K, D, Z and E each independently represent hydrogen, C_1-C_6 alkyl, phenyl, C_1-C_6 alkylphenyl or $-J-Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$ where J represents unsubstituted C_1 to C_6 alkylene; or two of K, D, Z and E

18

together with the carbon atoms of the aryl ring to which they are attached form a phenyl ring which is optionally substituted by one or more substituents selected from lower alkyl, phenyl or lower alkylphenyl.

R^1 to R^{18} each independently represent C_1 to C_6 alkyl, phenyl or C_1 to C_6 alkylphenyl.

Further preferred compounds of formula I include those wherein:

A and B both represent $-CH_2-$ or C_2H_4, particularly CH_2;

K, D, Z and E each independently represent hydrogen, C_1-C_6 alkyl phenyl or C_1-C_6 alkyl or $-J-Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$ where J is the same as A; or two of K, D, E and Z together with the carbon atoms of the aryl ring to which they are attached form an unsubstituted phenyl ring;

R^1 to R^{18} each independently represent C_1 to C_6 alkyl;

Still further preferred compounds of formula I include those wherein:

R^1 to R^{18} are the same and each represents C_1 to C_6 alkyl, particularly methyl.

Still further preferred compounds of formula I include those wherein:

K, D, Z and E are each independently selected from the group consisting of hydrogen or C_1 to C_6 alkyl,

particularly where each of K, D, Z and E represent the same group, especially where each of K, D, Z and E represent hydrogen; or

5   K represents $-CH_2-Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$ and D, Z and E are each independently selected from the group consisting of hydrogen or C_1 to C_6 alkyl, particularly where both D and E represent the same group, especially where D, Z and E represent hydrogen.
10

Especially preferred specific compounds of formula I include those wherein:

each R^1 to R^{12} is the same and represents methyl;
15   A and B are the same and represent $-CH_2-$;
K, D, Z and E are the same and represent hydrogen.

In a still further embodiment, at least one $(CR^xR^yR^z)$ group attached to Q^1 and/or Q^2, i.e. $CR^1R^2R^3$, $CR^4R^5R^6$, $CR^7R^8R^9$, or
20   $CR^{10}R^{11}R^{12}$, may instead be represented by the group (Ad) wherein:

Ad each independently represent an optionally substituted adamantyl or congressyl radical bonded to the phosphorous
25   atom via any one of its tertiary carbon atoms, the said optional substitution being by one or more substituents selected from hydrogen, lower alkyl, halo, cyano, nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}$ R^{26}, $C(S)R^{25}R^{26}$, SR^{27} or $C(O)SR^{27}$; or if both $(CR^xR^yR^z)$ groups
30   attached to either or both Q^1 and/or Q^2, or Q^3 (if present) together with either Q^1 or Q^2 (or Q^3) as appropriate, form an   optionally   substituted   2-phospha-

tricyclo[3.3.1.1{3,7}]decyl group or derivative thereof, or form a ring system of formula

$$
\begin{array}{c}
\text{Y} \\
R^{49}H \diagup\!\!\!\diagdown H\, R^{54} \\
R^{50}\!\!-\!\!\diagdown Q^2 \diagup\!\!-\!R^{53} \\
R^{51} \qquad R^{52}
\end{array}
$$

wherein

R^{49}, and R^{54}, each independently represent hydrogen, lower alkyl or aryl;

R^{50} to R^{53}, when present, each independently represent hydrogen, lower alkyl, aryl or Het; and

Y represents oxygen, sulfur or N-R^{55}; and R^{55}, when present, represents hydrogen, lower alkyl or aryl.

In this embodiment, formula I may be represented as:

$$(Ad)_S(CR^7R^8R^9)_T Q^2\text{-}A\text{-}(K,D)Ar(E,Z)\text{-}B\text{-}Q^1(Ad)_U(CR^1R^2R^3)_V$$
wherein Ar, A, B, K, D, E and Z, Q^1, Q^2, and Q^3, and R^1 to R^{27} are as defined hereinbefore except that K, D, E and Z may represent $-J\text{-}Q^3(Ad)_W(CR^{13}(R^{14})(R^{15})_X$ instead of $-J\text{-}Q^3(CR^{13}(R^{14})(R^{15}))CR^{16}(R^{17})(R^{18})$ and Ad is as defined above,

S & U = 0, 1 or 2 provided that S + U ≥ 1;

T & V = 0, 1 or 2 provided that T + V ≤ 3;

W & X = 0, 1 or 2.

In addition to the preferred embodiments for R^1 to R^{18}, Q^1 to Q^3, A, B, J (when present), K, D, E or Z, R^{19} to R^{27},

noted hereinbefore, all of which equally apply to the present embodiment where at least one (Ad) group is present, the following also applies.

5   Further preferred compounds of formula I include those wherein:

A and B both represent $-CH_2-$ or $-C_2H_4-$, particularly $-CH_2-$;

10   K, D, Z and E each independently represent hydrogen, C_1-C_6 alkyl phenyl or C_1-C_6 alkyl or $-J-Q^3(Ad)_w(CR^{13}(R^{14})(R^{15}))_x$ where J is the same as A; or two of K, D, E and Z together with the carbon atoms of the aryl ring to which they are attached form an unsubstituted phenyl ring;

15

R^1 to R^3, R^7 to R^9, and R^{13} to R^{15} (when present) each independently represent C_1 to C_6 alkyl, and the total number of (Ad) groups attached to Q^1 and Q^2 is ≥ 3, i.e. S + U ≥ 3, and W and X = 0, 1 or 2.

20

Still further preferred compounds of formula I include those wherein:

R^1 to R^3, R^7 to R^9 and R^{13} to R^{15} (when present) are the
25   same and each represents C_1 to C_6 alkyl, particularly methyl, and the total number of (Ad) groups attached to Q^1 and Q^2 is ≥ 3, i.e. S + U ≥ 3.

Still further preferred compounds of formula I include
30   those wherein:

K, D, Z and E are each independently selected from the group consisting of hydrogen or C_1 to C_6 alkyl,

particularly where each of K, D, Z and E represent the same group, especially where each of K, D, Z and E represent hydrogen; or

5   K represents $-CH_2-Q^3(Ad)_w(CR^{13}(R^{14})(R^{15})_x$ and D, Z and E are each independently selected from the group consisting of hydrogen or C_1 to C_6 alkyl, particularly where both D and E represent the same group, especially where D, Z and E represent hydrogen, wherein W and X = 0, 1 or 2.

10

Especially preferred specific compounds of formula I include those wherein:

each R^1 to R^3, and R^7 to R^9 is the same and represents
15   methyl or the total number of (Ad) groups attached to Q^1 and Q^2 is 2, i.e. S + U = 2;
A and B are the same and represent $-CH_2-$;
K, D, Z and E are the same and represent hydrogen.

20   Especially preferred specific compounds of formula I include those wherein Ad is joined to Q_1 or Q_2 at the same position in each case. Preferably S ≥ 1 and U ≥ 1, more preferably, S = 2 and U ≥ 1 or vice versa, most preferably S & U = 2, wherein S is the number of (Ad) groups attached
25   to Q^2 and U is the number of (Ad) groups attached to Q^1.

Specific but non-limiting examples of bidentate ligands within this embodiment include the following: 1,2 bis(diadamantylphosphinomethyl)benzene, 1,2 bis(di-3,5-
30   dimethyladamantylphosphinomethyl)benzene, 1,2 bis(di-5-tert-butyladamantaylphosphinomethyl)benzene, 1,2 bis(1-adamantyl tert-butyl-phosphinomethyl)benzene, 1,2 bis(di-1-diamantanephosphinomethyl)benzene,   1-

[(diadamantylphosphinomethyl)-2-(di-tert-butylphosphinomethyl)]benzene,   1-(di-tert-butylphosphinomethyl)-2-(dicongressylphosphinomethyl)benzene,   1-(di-tert-butylphosphinomethyl)-2-(phospha-adamantylphosphinomethyl)benzene,   1-(diadamantylphosphinomethyl)-2-(phospha-adamantylphosphinomethyl)benzene, 1-(tert-butyladamantyl)-2-(di-adamantyl)-(phosphinomethyl)benzene and 1-[(P-(2,2,6,6,-tetra-methylphosphinan-4-one)phosphinomethyl)]-2-(phospha-adamantylphosphinomethyl)benzene.

Nevertheless, the skilled person in the art would appreciate that other bidentate ligands can be envisaged without departing from the scope of the invention.

In a yet further embodiment, the bidentate phosphine ligand is of general formula (III).

(III)
wherein:

A_1 and A_2, and A_3, A_4 and A_5 (when present), each independently represent lower alkylene;

K^1 is selected from the group consisting of hydrogen, lower alkyl, aryl, Het, halo, cyano, nitro, $-OR^{19}$, $-OC(O)R^{20}$, $-C(O)R^{21}$, $-C(O)OR^{22}$, $-N(R^{23})R^{24}$, $-C(O)N(R^{25})R^{26}$, $-C(S)(R^{27})R^{28}$, $-SR^{29}$, $-C(O)SR^{30}$, $-CF_3$ or $-A_3-Q^3(X^5)X^6$;

D^1 is selected from the group consisting of hydrogen, lower alkyl, aryl, Het, halo, cyano, nitro, $-OR^{19}$, $-OC(O)R^{20}$, $-C(O)R^{21}$, $-C(O)OR^{22}$, $-N(R^{23})R^{24}$, $-C(O)N(R^{25})R^{26}$, $-C(S)(R^{27})R^{28}$, $-SR^{29}$, $-C(O)SR^{30}$, $-CF_3$ or $-A_4-Q^4(X^7)X^8$;

E^1 is selected from the group consisting of hydrogen, lower alkyl, aryl, Het, halo, cyano, nitro, $-OR^{19}$, $-OC(O)R^{20}$, $-C(O)R^{21}$, $-C(O)OR^{22}$, $-N(R^{23})R^{24}$, $-C(O)N(R^{25})R^{26}$, $-C(S)(R^{27})R^{28}$, $-SR^{29}$, $-C(O)SR^{30}$, $-CF_3$ or $-A_5-Q^5(X^9)X^{10}$;

or both D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an optionally substituted phenyl ring:

X^1 represents $CR^1(R^2)(R^3)$, congressyl or adamantyl, X^2 represents $CR^4(R^5)(R^6)$, congressyl or adamantyl, or X^1 and X^2 together with Q^2 to which they are attached form an optionally substituted 2-phospha-tricyclo[3.3.1.1{3,7}]decyl group or derivative thereof, or X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa
25
(IIIa)

X^3 represents $CR^7(R^8)(R^9)$, congressyl or adamantyl, X^4 represents $CR^{10}(R^{11})(R^{12})$, congressyl or adamantyl, or X^3 and X^4 together with Q^1 to which they are attached form an

5   optionally substituted 2-phospha-tricyclo[3.3.1.1{3,7}]decyl group or derivative thereof, or X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb
(IIIb)

10   X^5 represents $CR^{13}(R^{14})(R^{15})$, congressyl or adamantyl, X^6 represents $CR^{16}(R^{17})(R^{18})$, congressyl or adamantyl, or X^5 and X^6 together with Q^3 to which they are attached form an optionally substituted 2-phospha-tricyclo[3.3.1.1{3,7}]decyl group or derivative thereof,

15   or X^5 and X^6 together with Q^3 to which they are attached form a ring system of formula IIIc

(IIIc)

X^7 represents $CR^{31}(R^{32})(R^{33})$, congressyl or adamantyl, X^8 represents $CR^{34}(R^{35})(R^{36})$, congressyl or adamantyl, or X^7 and X^8 together with Q^4 to which they are attached form an optionally substituted 2-phospha-

5   tricyclo[3.3.1.1{3,7}]decyl group or derivative thereof, or X^7 and X^8 together with Q^4 to which they are attached form a ring system of formula IIId

(IIId)

X^9 represents $CR^{37}(R^{38})(R^{39})$, congressyl or adamantyl, X^{10}

10   represents $CR^{40}(R^{41})(R^{42})$, congressyl or adamantyl, or X^9 and X^{10} together with Q^5 to which they are attached form an optionally substituted 2-phospha-tricyclo[3.3.1.1.{3,7}]decyl group or derivative thereof, or X^9 and X^{10} together with Q^5 to which they are attached

15   form a ring system of formula IIIe

(IIIe)

and in this yet further embodiment,
Q^1 and Q^2, and Q^3, Q^4 and Q^5 (when present), each

20   independently represent phosphorus, arsenic or antimony;

M represents a Group VIB or VIIIB metal or metal cation thereof;

L_1 represents an optionally substituted cyclopentadienyl, indenyl or aryl group;

5   L_2 represents one or more ligands each of which are independently selected from hydrogen, lower alkyl, alkylaryl, halo, CO, $P(R^{43})(R^{44})R^{45}$ or $N(R^{46})(R^{47})R^{48}$;

R^1 to R^{18} and R^{31} to R^{42}, when present, each independently
10   represent hydrogen, lower alkyl, aryl, halo or Het;

R^{19} to R^{30} and R^{43} to R^{48}, when present, each independently represent hydrogen, lower alkyl, aryl or Het;

15   R^{49}, R^{54} and R^{55}, when present, each independently represent hydrogen, lower alkyl or aryl;

R^{50} to R^{53}, when present, each independently represent hydrogen, lower alkyl, aryl or Het;
20
Y^1, Y^2, Y^3, Y^4 and Y^5, when present, each independently represent oxygen, sulfur or $N-R^{55}$;

n = 0 or 1;
25
and m = 0 to 5;

provided that when n = 1 then m equals 0, and when n equals 0 then m does not equal 0.
30
Preferably in a compound of formula III when both K^1 represents $-A_3-Q^3(X^5)X^6$ and E^1 represents $-A_5-Q^5(X^9)X^{10}$, then D^1 represents $-A_4-Q^4(X^7)X^8$.

Preferably, in this embodiment, R^1 to R^{18} and R^{31} to R^{42}, when present, each independently represent hydrogen, optionally substituted C_1 to C_6 alkyl, C_1-C_6 alkyl phenyl (wherein the phenyl group is optionally substituted as defined herein), trifluoromethyl or phenyl (wherein the phenyl group is optionally substituted as defined herein). Even more preferably, R^1 to R^{18} and R^{31} to R^{42}, when present, each independently represent hydrogen, C_1 to C_6 alkyl, which is optionally substituted as defined herein, trifluoromethyl or optionally substituted phenyl. Even more preferably, R^1 to R^{18} and R^{31} to R^{42}, when present each independently represent hydrogen, non-substituted C_1 to C_6 alkyl or phenyl which is optionally substituted with one or more substituents selected from non-substituted C_1 to C_6 alkyl or OR^{19} where R^{19} represents hydrogen or unsubstituted C_1 to C_6 alkyl. More preferably, R^1 to R^{18} and R^{31} to R^{42}, when present, each independently represent hydrogen or non-substituted C_1 to C_6 alkyl such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl and cyclohexyl, especially methyl. Most preferably, R^1 to R^{18} and R^{31} to R^{42} when present, each independently represent non-substituted C_1 to C_6 alkyl such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl and cyclohexyl, especially methyl.

Alternatively, or additionally, one or more of the groups R^1 to R^3, R^4 to R^6, R^7 to R^9, R^{10} to R^{12}, R^{13} to R^{15}, R^{16} to R^{18}, R^{31} to R^{33}, R^{34} to R^{36}, R^{37} to R^{39} or R^{40} to R^{42} (when present) together with the carbon atom to which they are attached independently may form cyclic alkyl structures such as 1-norbornyl or 1-norbornadienyl.

Alternatively, or additionally, one or more of the groups R^1 and R^2, R^4 and R^5, R^7 and R^8, R^{10} and R^{11}, R^{13} and R^{14}, R^{16} and R^{17}, R^{31} and R^{32}, R^{34} and R^{35}, R^{37} and R^{38} or R^{40} and R^{41}

5   (when present) together with the carbon atom to which they are attached independently may form a cyclic alkyl structures, preferably a C_5 to C_7 cyclic alkyl structure such as cyclohexyl and cyclopentyl, and R^3, R^6, R^9, R^{12}, R^{15}, R^{18}, R^{33}, R^{36}, R^{39} and R^{42} (when present) each

10   independently represent hydrogen, lower alkyl, trifluoromethyl or aryl as defined above, particularly non-substituted C_1 to C_6 alkyl and hydrogen, especially non-substituted C_1 to C_6 alkyl.

15   In an especially preferred embodiment, each of R^1 to R^{18} and R^{31} to R^{42}, when present, do not represent hydrogen. Suitably, such an arrangement means Q^1, Q^2, Q^3, Q^4 and Q^5 are bonded to a carbon atom of X^1 to X^{10}, respectively, which bears no hydrogen atoms.

20

Preferably, R^1, R^4, R^7, R^{10}, R^{13}, R^{16}, R^{31}, R^{34}, R^{37} and R^{40} (when present), each represent the same substituent as defined herein; R^2, R^5, R^8, R^{11}, R^{14}, R^{17}, R^{32}, R^{35}, R^{38} and R^{41} (when present), each represent the same substituent as

25   defined herein; and R^3, R^6, R^9, R^{12}, R^{15}, R^{18}, R^{33}, R^{36}, R^{39} and R^{42} (when present), each represent the same substituent as defined herein. More preferably R^1, R^4, R^7, R^{10}, R^{13}, R^{16}, R^{31}, R^{34}, R^{37} and R^{40} (when present) each represent the same C_1-C_6 alkyl, particularly non-

30   substituted C_1-C_6 alkyl, such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl or cyclohexyl, or trifluoromethyl; R^2, R^5, R^{8}, R^{11}, R^{14}, R^{17}, R^{32}, R^{35}, R^{38} and R^{41} (when present), each independently

represent the same C_1-C_6 alkyl as defined above, or trifluoromethyl; and R^3, R^6, R^9, R^{12}, R^{15}, R^{18}, R^{33}, R^{36}, R^{39} and R^{42} (when present), each independently represent the same C_1-C_6 alkyl as defined above, or trifluoromethyl. For example: R^1, R^4, R^7, R^{10}, R^{13} and R^{16} (when present) each represent methyl; R^2, R^5, R^8, R^{11}, R^{14} and R^{17} each represent ethyl (when present); and, R^3, R^6, R^9, R^{12}, R^{15} and R^{18} (when present) each represent n-butyl or n-pentyl.

In an especially preferred embodiment each R^1 to R^{18} and R^{31} to R^{42} group (when present) represents the same substituent as defined herein. Preferably, each R^1 to R^{18} and R^{31} to R^{42} group represents the same C_1 to C_6 alkyl group, particularly non-substituted C_1-C_6 alkyl, such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl and cyclohexyl, or trifluoromethyl. Most preferably, each R^1 to R^{18} and R^{31} to R^{42} group represents non-substituted C_1-C_6 alkyl, particularly methyl.

The term adamantyl when used herein means an adamantyl group which may be bonded to Q^1, Q^2, Q^3, Q^4 and Q^5, respectively, in position 1 or 2. Tricyclo[3.3.1.1.{3,7}]decyl is the systematic name for an adamantyl group, suitably Q^1, Q^2, Q^3, Q^4 and Q^5, respectively, may be bonded to the 1 position or 2 position of one or two tricyclo[3.3.1.1.{3,7}]decyl groups. Preferably, Q^1 and Q^2, and Q^3, Q^4 and Q^5, when present, is bonded to a tertiary carbon of one or more adamantyl groups. Suitably, when the adamantyl group represents unsubstituted adamantyl, Q^1 and Q^2, and Q^3, Q^4 and Q^5 when present are preferably bonded to the 1 position of one or more tricyclo[3.3.1.1{3,7}]decyl groups

i.e. the carbon atom of the adamantyl group bears no hydrogen atom.

The adamantyl group may optionally comprise, besides hydrogen atoms, one or more substituents selected from lower alkyl, $-OR^{19}$, $-OC(O)R^{20}$, halo, nitro, $-C(O)R^{21}$, $-C(O)OR^{22}$, cyano, aryl, $-N(R^{23})R^{24}$, $-C(O)N(R^{25})R^{26}$, $-C(S)(R^{27})R^{28}$, $-CF_3$, $-P(R^{56})R^{57}$, $-PO(R^{58})(R^{59})$, $-PO_3H_2$, $-PO(OR^{60})(OR^{61})$, or $-SO_3R^{62}$, wherein R^{19}, R^{20}, R^{21}, R^{22}, R^{23}, R^{24}, R^{25}, R^{26}, R^{27}, R^{28}, lower alkyl, cyano and aryl are as defined herein and R^{56} to R^{62} each independently represent hydrogen, lower alkyl, aryl or Het.

Suitably, when the adamantyl group is substituted with one or more substituents as defined above, highly preferred substituents include unsubstituted C_1 to C_8 alkyl, $-OR^{19}$, $-OC(O)R^{20}$, phenyl, $-C(O)OR^{22}$, fluoro, $-SO_3H$, $-N(R^{23})R^{24}$, $-P(R^{56})R^{57}$, $-C(O)N(R^{25})R^{26}$ and $-PO(R^{58})(R^{59})$, $-CF_3$, wherein R^{19} represents hydrogen, unsubstituted C_1-C_8 alkyl or phenyl, R^{20}, R^{22}, R^{23}, R^{24}, R^{25}, R^{26} each independently represent hydrogen or unsubstituted C_1-C_8 alkyl, R^{56} to R^{53}, R^{56} each independently represent unsubstituted C_1-C_8 alkyl or phenyl.

Suitably, the adamantyl group may comprise, besides hydrogen atoms, up to 10 substituents as defined above, preferably up to 5 substituents as defined above, more preferably up to 3 substituents as defined above. Suitably, when the adamantyl group comprises, besides hydrogen atoms, one or more substituents as defined herein, preferably each substituent is identical. Preferred substituents are unsubstituted C_1-C_8 alkyl and trifluoromethyl, particularly unsubstituted C_1-C_8 alkyl

such as methyl. A highly preferred adamantyl group comprises hydrogen atoms only i.e. the adamantyl group is not substituted.

5   Preferably, when more than one adamantyl group is present in a compound of formula III, each adamantyl group is identical.

By the term 2-phospha-tricyclo[3.3.1.1.{3,7}]decyl group
10   we mean a 2-phospha-adamantyl group formed by the combination of X^1 and X^2 together with Q^2 to which they are attached, a 2-phospha-adamantyl group formed by the combination of X^3 and X^4 together with Q^1 to which they are attached, a 2-phospha-adamantyl group formed by the
15   combination of X^5 and X^6 together with Q^3 to which they are attached, a 2-phospha-adamantyl group formed by the combination of X^7 and X^8 together with Q^4 to which they are attached and a 2-phospha-adamantyl group formed by the combination of X^9 and X^{10} together with Q^5 to which they
20   are attached, wherein Q^1, Q^2, Q^3, Q^4 and Q^5 is in the 2-position of the adamantyl group of which it forms an integral part and each of Q^1, Q^2, Q^3, Q^4 and Q^5 represents phosphorus.

25   The 2-phospha-tricyclo[3.3.1.1.{3,7}]decyl group (referred to as 2-phospha-adamantyl group herein) may optionally comprise, beside hydrogen atoms, one or more substituents. Suitable substituents include those substituents as defined herein in respect of the adamantyl group. Highly
30   preferred substituents include lower alkyl, particularly unsubstituted C_1-C_8 alkyl, especially methyl, trifluoromethyl, $-OR^{19}$ wherein R^{19} is as defined herein particularly unsubstituted C_1-C_8 alkyl or aryl, and 4-

dodecylphenyl. When the 2-phospha-adamantyl group includes more than one substituent, preferably each substituent is identical.

5   Preferably, the 2-phospha-adamantyl group is substituted on one or more of the 1, 3, 5 or 7 positions with a substituent as defined herein. More preferably, the 2-phospha-adamantyl group is substituted on each of the 1, 3 and 5 positions. Suitably, such an arrangement means the
10   phosphorous atom of the 2-phospha-adamantyl group is bonded to carbon atoms in the adamantyl skeleton having no hydrogen atoms. Most preferably, the 2-phospha-adamantyl group is substituted on each of the 1, 3, 5 and 7 positions. When the 2-phospha-adamantyl group includes
15   more than 1 substituent preferably each substituent is identical. Especially preferred substituents are unsubstituted C_1-C_8 alkyl and trifluoromethyl, particularly unsubstituted C_1-C_8 alkyl such as methyl.

20   Preferably, the 2-phospha-adamantyl group includes additional heteroatoms, other than the 2-phosphorous atom, in the 2-phospha-adamantyl skeleton. Suitable additional heteroatoms include oxygen and sulphur atoms, especially oxygen atoms. More preferably, the 2-phospha-adamantyl
25   group includes one or more additional heteroatoms in the 6, 9 and 10 positions. Even more preferably, the 2-phospha-adamantyl group includes an additional heteroatom in each of the 6, 9 and 10 positions. Most preferably, when the 2-phospha-adamantyl group includes two or more
30   additional heteroatoms in the 2-phospha-adamantyl skeleton, each of the additional heteroatoms are identical. An especially preferred 2-phospha-adamantyl group, which may optionally be substituted with one or

more substituents as defined herein, includes an oxygen
atom in each of the 6, 9 and 10 positions of the 2-
phospha-adamantyl skeleton.

5   Highly preferred 2-phospha-adamantyl groups as defined
herein include 2-phospha-1,3,5,7-tetramethyl-6,9,10-
trioxadamantyl group, 2-phospha-1,3,5-trimethyl-6,9,10-
trioxadamantyl group, 2-phospha-1,3,5,7-
tetra(trifluoromethyl)-6,9,10-trioxadamantyl group, and 2-
10 phospha-1,3,5-tri(trifluoromethyl)-6,9,10-trioxadamantyl
group. Most preferably, the 2-phospha-adamantyl is
selected from 2-phospha-1,3,5,7-tetramethyl-6,9,10-
trioxadamantyl group or 2-phospa-1,3,5,-trimethyl-6,9,10-
trioxadamantyl group.

15

Preferably, when more than one 2-phospha-adamantyl group
is present in a compound of formula III, each 2-phospha-
adamantyl group is identical.

20 The above definition of the term "2-phospha-
tricyclo[3.3.1.1.{3,7}]decyl group" applies equally to the
group when it is present in formula I but wherein X^n in
formula III, i.e. X^1, X^2, X^3...X^{10}, is denoted $CR^xR^yR^z$, i.e.
$CR^1R^2R^3$,...$CR^{16}R^{17}R^{18}$, in formula I.

25

The term congressyl when used herein means a congressyl
group (also known as diamantyl group) which may be bonded
to Q^1, Q^2, Q^3, Q^4 and Q^5 respectively. Preferably, Q^1 and
Q^2, and Q^3, Q^4 and Q^5, when present, are bonded to one of
30 the tertiary carbon atoms of the congressyl groups.
Suitably, when the congressyl group is unsubstituted, Q^1
and Q^2, and Q^3, Q^4 and Q^5 when present, are preferably
bonded to the 1-position of one or more congressyl groups.

The congressyl group may optionally comprise, beside hydrogen atoms, one or more substituents. Suitable substituents include those substituents as defined herein

5   in respect of the adamantyl group. Highly preferred substituents include unsubstituted C_1-C_6 alkyl groups, particularly methyl, and trifluoromethyl. Most preferably, the congressyl group is unsubstituted and comprises hydrogen atoms only.

10

Preferably, when more than one congressyl group is present in a compound of formula III, each congressyl group is identical.

15   Preferably, where one or more ring systems of formula IIIa, IIIb, IIIc, IIId or IIIe are present in a compound of formula III, R^{50} to R^{53} each independently represent lower alkyl, aryl or Het, which groups are optionally substituted and/or terminated as defined herein. Such an

20   arrangement means Q^2, Q^1, Q^3, Q^4 and Q^5 of the ring system of formula IIIa to IIIe, respectively, is not bonded to a carbon atom bearing a hydrogen atom. Even more preferably, R^{50} to R^{53} each independently represent optionally substituted C_1-C_6 alkyl, preferably non-substituted C_1-C_6

25   alkyl, phenyl optionally substituted with non-substituted C_1-C_6 alkyl or OR^{19} where R^{19} represents non-substituted C_1-C_6 alkyl, or trifluoromethyl. Even more preferably R^{50} to R^{53} each represent the same group as defined herein, particularly non-substituted C_1-C_6 alkyl, especially

30   methyl.

Preferably, where one or more ring system of formula IIIa to IIIe are present in a compound of formula III, R^{49} and

R^{54} each independently represent optionally substituted C_1-C_6 alkyl, preferably non-substituted C_1-C_6 alkyl, phenyl optionally substituted with non-substituted C_1-C_6 alkyl or OR^{19} where R^{19} represents non-substituted C_1-C_6 alkyl,

5   trifluoromethyl or hydrogen. More preferably, R^{49} and R^{54} represent the same group as defined herein, especially hydrogen.

Preferably, where one or more ring systems of formula IIIa

10   to IIIe are present in a compound of formula III, Y^1 to Y^5 are identical. Most preferably, each of Y^1 to Y^5 represents oxygen. Preferably, where more than one ring system of formula IIIa to IIIe is present in a compound of formula III, each such ring system is identical.

15

Preferred embodiments of the present invention include those wherein:

X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, X^3

20   represents $CR^7(R^8)(R^9)$ and X^4 represents $CR^{10}(R^{11})(R^{12})$;

X^1 represents $CR^1(R^2)(R^3)$, X^2 represents adamantyl, X^3 represents $CR^7(R^8)(R^9)$ and X^4 represents adamantyl;

25   X^1 represents $CR^1(R^2)(R^3)$, X^2 represents congressyl, X^3 represents $CR^7(R^8)(R^9)$ and X^4 represents congressyl;

X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, and X^3 and X^4 together with Q^1 to which they are attached form a

30   ring system of formula IIIb or a 2-phospha-adamantyl group;

X^1 represents $CR^1(R^2)(R^3)$, X^2 represents adamantyl, X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb or a 2-phospha-adamantyl group;

5 X^1 represents $CR^1(R^2)(R^3)$, X^2 represents congressyl, X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb or a 2-phospha-adamantyl group;

X^1 to X^4 each independently represent adamantyl;

10

X^1 to X^4 each independently represent congressyl;

X^1 and X^2 each independently represent adamantyl and X^3 and X^4 each independently represent congressyl;

15

X^1 and X^3 independently represent adamantyl and X^2 and X^4 independently represent congressyl;

X^1 and X^2 independently represent adamantyl, X^3 represents
20 $CR^7(R^8)(R^9)$ and X^4 represents $CR^{10}(R^{11})(R^{12})$;

X^1 and X^2 independently represent congressyl, X^3 represents $CR^7(R^8)(R^9)$ and X^4 represents $CR^{10}(R^{11})(R^{12})$;

25 X^1 and X^2 independently represent adamantyl, and X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb or a 2-phospha-adamantyl group;

X^1 and X^2 independently represent congressyl, and X^3 and X^4
30 together with Q^1 to which they are attached form a ring system of formula IIIb or a 2-phospha-adamantyl group;

X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa, and X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb;

5

X^1 and X^2 together with Q^2 to which they are attached form a 2-phospha-adamantyl group, and X^3 and X^4 together with Q^1 to which they are attached form a 2-phospha-adamantyl group;

10

Highly preferred embodiments of the present invention include those wherein:

X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, X^3
15   represents $CR^7(R^8)(R^9)$ and X^4 represents $CR^{10}(R^{11})(R^{12})$;

X^1 represents $CR^1(R^2)(R^3)$, X^2 represents adamantyl, X^3
represents $CR^7(R^8)(R^9)$ and X^4 represents adamantyl;

20   X^1 represents $CR^1(R^2)(R^3)$, X^2 represents congressyl, X^3
represents $CR^7(R^8)(R^9)$ and X^4 represents congressyl;

X^1 to X^4 each independently represent adamantyl;

25   X^1 to X^4 each independently represent congressyl;

X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa, and X^3 and X^4 together with Q^1 to which they are attached form a ring system of
30   formula IIIb;

X^1 and X^2 together with Q^2 to which they are attached form a 2-phospha-adamantyl group, and X^3 and X^4 together with Q^1

to which they are attached form a 2-phospha-adamantyl group;

Preferably in a compound of formula III, X^1 is identical
to X^3 and X^2 is identical to X^4. More preferably, X^1 is
identical to X^3 and X^5, X^7 and X^9 when present, and X^2 is
identical to X^4 and X^6, X^8 and X^{10} when present. Even more
preferably, X^1 to X^4 are identical. Most preferably, X^1 to
X^4 are identical to each of X^6 to X^{10} when present.

Preferably, in the compound of formula III, X^1 and X^2
represent identical substituents, X^3 and X^4 represent
identical substituents, X^5 and X^6 (when present) represent
identical substituents, X^7 and X^8 (when present) represent
identical substituents, and X^9 and X^{10} (when present)
represent identical substituents.

Preferably, in a compound of formula III, K^1 represents –
A_3-Q^3(X^5)X^6, hydrogen, lower alkyl, $-CF_3$, phenyl or lower
alkyl phenyl. More preferably, K^1 represents $-A_3$-Q^3(X^5)X^6,
hydrogen, unsubstituted C_1-C_6 alkyl, unsubstituted phenyl,
trifluoromethyl or C_1-C_6 alkyl phenyl.

In a particular preferred embodiment K^1 in a compound of
formula III represents hydrogen.

In an alternative embodiment where K^1 does not represent
hydrogen, K^1 represents $-A_3$-Q^3(X^5)X^6. Preferably, X^5 is
identical to X^3 or X^1, and X^6 is identical to X^2 or X^4.
More preferably, X^5 is identical to both X^3 and X^1, and X^6
is identical to both X^2 and X^4. Even more preferably, $-A_3$-
Q^3(X^5)X^6 is identical to either $-A_1$-Q^2(X^1)X^2 or $-A_2$-Q^1(X^3)X^4.

Most preferably, $-A_3-Q^3(X^5)X^6$ is identical to both $-A_1-Q^2(X^1)X^2$ and $-A_2-Q^1(X^3)X^4$.

Most preferably, K^1 represents hydrogen in a compound of

5   formula III.

Preferably, in the compound of formula III, D^1 represents $-A_4-Q^4(X^7)X^8$, hydrogen, lower alkyl, CF_3, phenyl or lower alkylphenyl, and E^1 represents $-A_5-Q^5(X^9)X^{10}$, hydrogen,

10   lower alkyl, CF_3, phenyl or lower alkylphenyl, or D^1 and E^1 together with the carbons of the cyclopentadienyl ring to which they are attached form an optionally substituted phenyl ring. More preferably, D^1 represents $-A_4-Q^4(X^7)X^8$, hydrogen, phenyl, C_1-C_6 alkylphenyl, unsubstituted C_1-C_6

15   alkyl, such as methyl, ethyl, propyl, butyl, pentyl and hexyl, or CF_3; E^1 represents $-A_5-Q^5(X^9)X^{10}$, hydrogen, phenyl, C_1-C_6 alkylphenyl, unsubstituted C_1-C_6 alkyl such as methyl, ethyl, propyl, butyl, pentyl and hexyl, or $-CF_3$; or both D^1 and E^1 together with the carbon atoms of

20   the cyclopentadienyl ring to which they are attached form a phenyl ring which is optionally substituted with one or more groups selected from phenyl, C_1-C_6 alkylphenyl, unsubstituted C_1-C_6 alkyl or $-CF_3$.

25   Suitably, when D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an optionally substituted phenyl ring, the metal M or cation thereof is attached to an indenyl ring system.

30   In a particular preferred embodiment, D^1 in a compound of formula III, represents hydrogen.

41

In an alternative embodiment where D^1 does not represent hydrogen, D^1 represents $-A_4-Q^4(X^7)X^8$. Preferably X^8 is identical to X^4 or X^2, and X^7 is identical to X^1 or X^3. More preferably, X^8 is identical to both X^4 and X^2, and X^7

5   is identical to X^1 and X^3. Even more preferably, $-A_4-Q^4(X^7)X^8$ is identical to either $-A_1-Q^2(X^1)X^2$ or $-A_2-Q^1(X^3)X^4$. Most preferably, $-A_4-Q^4(X^7)X^8$ is identical to both $-A_2-Q^1(X^3)X^4$, and $-A_3-Q^3(X^5)X^6$ if present.

10   In a particular preferred embodiment, E^1 in a compound of formula III represents hydrogen.

In an alternative embodiment where E^1 does not represent hydrogen, E^1 represents $-A_5-Q^5(X^9)X^{10}$. Preferably X^{10} is

15   identical to X^4 or X^2, and X^9 is identical to X^1 or X^3. More preferably, X^{10} is identical to both X^4 and X^2, and X^9 is identical to X^1 and X^3. Even more preferably, $-A_5-Q^5(X^9)X^{10}$ is identical to either $-A_1-Q^2(X^1)X^2$ or $-A_2-Q^1(X^3)X^4$. Most preferably, $-A_5-Q^5(X^9)X^{10}$ is identical to both $-A_1-Q^2(X^1)X^2$ and $-A_2-Q^1(X^3)X^4$, and $-A_3-Q^3(X^5)X^6$ and $-A_4-Q^4(X^7)X^8$ if

20   $Q^2(X^1)X^2$ and $-A_2-Q^1(X^3)X^4$, and $-A_3-Q^3(X^5)X^6$ and $-A_4-Q^4(X^7)X^8$ if present.

Preferably, in the compound of formula III, when D^1 and E^1 together with the carbon atoms of the cyclopentadienyl

25   ring to which they are attached do not form an optionally substituted phenyl ring, each of K^1, D^1 and E^1 represent an identical substituent.

In an alternative preferred embodiment, D^1 and E^1 together

30   with the carbons of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring.

42

Highly preferred embodiments of compounds of formula III include those wherein:

5   K^1, D^1 and E^1 are identical substituents as defined herein, particularly where K^1, D^1 and E^1 represent hydrogen;

K^1 represents hydrogen, and D^1 and E^1 together with the carbons of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

10

K^1 represents $-A_3-Q^3(X^5)X^6$ as defined herein and both D^1 and E^1 represent H;

K^1 represents $-A_3-Q^3(X^5)X^6$ as defined herein and D^1 and E^1
15   together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

K^1 represents $-A_3-Q^3(X^5)X^6$, D^1 represents $-A_4-Q^4(X^7)X^8$ and E^1
20   represents $-A_5-Q^5(X^9)X^{10}$.

Especially preferred compounds of formula III include those where both D^1 and E^1 represent hydrogen or D^1 and E^1 together with the carbon atoms of the cyclopentadienyl
25   ring to which they are attached form an unsubstituted phenyl ring, particularly those compounds where both D^1 and E^1 represent hydrogen.

Preferably, in the compound of formula III, A_1 and A_2, and
30   A_3, A_4 and A_5 (when present), each independently represent C_1 to C_6 alkylene which is optionally substituted as defined herein, for example with lower alkyl groups. Suitably, A_1 and A_2, and A_3, A_4 and A_5 (when present) may

include a chiral carbon atom. Preferably, the lower alkylene groups which A_1 to A_5 may represent are non-substituted. A particular preferred lower alkylene, which A_1 to A_5 may independently represent, is $-CH_2-$ or $-C_2H_4-$.

5 Most preferably, each of A_1 and A_2, and A_3, A_4 and A_5 (when present), represent the same lower alkylene as defined herein, particularly $-CH_2-$.

In the compound of formula III, preferably each Q^1 and Q^2,

10 and Q^3, Q^4 and Q^5 (when present) are the same. Most preferably, each Q^1 and Q^2, and Q^3, Q^4 and Q^5 (when present), represents phosphorus.

It will be appreciated by those skilled in the art that

15 the compounds of formula III may function as ligands that coordinate with the Group VIB or Group VIIIB metal or compound thereof in the formation of the catalyst system of the invention. Typically, the Group VIB or Group VIIIB metal or compound thereof coordinates to the one or more

20 phosphorus, arsenic and/or antimony atoms of the compound of formula III. It will be appreciated that the compounds of formula III may be referred to broadly as "metallocenes".

25 Suitably, when n = 1 and L_1 represents an optionally substituted cyclopentadienyl or indenyl group, the compounds of formula III may contain either two cyclopentadienyl rings, two indenyl rings or one indenyl and one cyclopentadienyl ring (each of which ring systems

30 may optionally be substituted as described herein). Such compounds may be referred to as "sandwich compounds" as the metal M or metal cation thereof is sandwiched by the two ring systems. The respective cyclopentadienyl and/or

indenyl ring systems may be substantially coplanar with respect to each other or they may be tilted with respect to each other (commonly referred to as bent metallocenes).

5 Alternatively, when n = 1 and L_1 represents aryl, the compounds of the invention may contain either one cyclopentadienyl or one indenyl ring (each of which ring systems may optionally be substituted as described herein) and one aryl ring which is optionally substituted as

10 defined herein. Suitably, when n = 1 and L_1 represents aryl then the metal M of the compounds of formula III as defined herein is typically in the form of the metal cation.

15 In a particularly preferred embodiment of the present invention, in a compound of formula III, n = 1, L_1 is as defined herein and m = 0.

Preferably, when n = 1 in the compound of formula III, L_1

20 represents cyclopentadienyl, indenyl or aryl ring each of which rings are optionally substituted by one or more substituents selected from hydrogen, lower alkyl, halo, cyano, nitro, $-OR^{19}$, $-OC(O)R^{20}$, $-C(O)R^{21}$, $-C(O)OR^{22}$, $-N(R^{23})R^{24}$, $-C(O)N(R^{25})R^{26}$, $-C(S)(R^{27})R^{28}$ $-SR^{29}$, $-C(O)SR^{30}$,

25 $-CF_3$ or ferrocenyl (by which we mean the cyclopentadienyl, indenyl or aryl ring which L_1 may represent is bonded directly to the cyclopentadienyl ring of the ferrocenyl group), wherein R^{19} to R^{30} is as defined herein. More preferably, if the cyclopentadienyl, indenyl or aryl ring

30 which L_1 may represent is substituted it is preferably substituted with one or more substituents selected from unsubstituted C_1-C_6 alkyl, halo, cyano, $-OR^{19}$, $-OC(O)R^{20}$, $-C(O)R^{21}$, $-C(O)OR^{22}$, $-N(R^{23})R^{24}$ where R^{19}, R^{20}, R^{21}, R^{22}, R^{23}

and R^{24} each independently represent hydrogen or C_1-C_6 alkyl. Even more preferably, if the cyclopentadienyl, indenyl or aryl ring which L_1 may represent is substituted, it is preferably substituted with one or more substituents selected from unsubstituted C_1-C_6 alkyl.

Preferably, when $n = 1$, L_1 represents cyclopentadienyl, indenyl, phenyl or napthyl optionally substituted as defined herein. Preferably, the cyclopentadienyl, indenyl, phenyl or napthyl groups are unsubstituted. More preferably, L_1 represents cyclopentadienyl, indenyl or phenyl, each of which rings are unsubstituted. Most preferably, L_1 represents unsubstituted cyclopentadienyl.

Alternatively, when $n = 0$, the compounds of the invention contain only one cyclopentadienyl or indenyl ring (each of which ring systems may optionally be substituted as described herein). Such compounds may be referred to as "half sandwich compounds". Preferably, when $n = 0$ then m represents 1 to 5 so that the metal M of the compounds of formula III has an 18 electron count. In other words, when metal M of the compounds of formula III is iron, the total number of electrons contributed by the ligands L_2 is typically five.

In a particularly preferred alternative embodiment of the present invention, in a compound of formula III, $n = 0$, L_2 is as defined herein and $m = 3$ or 4, particularly 3.

Preferably, when n is equal to zero and m is not equal to zero in a compound of formula III, L_2 represents one or more ligands each of which are independently selected from lower alkyl, halo, $-CO$, $-P(R^{43})(R^{44})R^{45}$ or $-N(R^{46})(R^{47})R^{48}$.

More preferably, L_2 represents one or more ligands each of which are independently selected from unsubstituted C_1 to C_4 alkyl, halo, particularly chloro, $-CO$, $-P(R^{43})(R^{44})R^{45}$ or $-N(R^{46})(R^{47})R^{48}$, wherein R^{43} to R^{48} are independently

5   selected from hydrogen, unsubstituted C_1 to C_6 alkyl or aryl, such as phenyl.

Suitably, the metal M or metal cation thereof in the compounds of formula III is typically bonded to the

10   cyclopentadienyl ring(s), the cyclopentadienyl moiety of the indenyl ring(s) if present, the aryl ring if present, and/or the ligands L_2 if present. Typically, the cyclopentadienyl ring or the cyclopentadienyl moiety of the indenyl ring exhibits a pentahapto bonding mode with

15   the metal; however other bonding modes between the cyclopentadienyl ring or cyclopentadienyl moiety of the indenyl ring and the metal, such as trihapto coordination, are also embraced by the scope of the present invention.

20   Most preferably, in a compound of formula III, n = 1, m = 0 and L_1 is defined herein, particularly unsubstituted cyclopentadienyl.

Preferably M represents a Group VIB or VIIIB metal. In

25   other words the total electron count for the metal M is 18.

Preferably, in the compound of formula III, M represents Cr, Mo, Fe, Co or Ru, or a metal cation thereof. Even more

30   preferably, M represents Cr, Fe, Co or Ru or a metal cation thereof. Most preferably, M is selected from a Group VIIIB metal or metal cation thereof. An especially preferred Group VIIIB metal is Fe. Although the metal M as

47

defined herein may be in a cationic form, preferably it carries essentially no residual charge due to coordination with L_1 and/or L_2 as defined herein.

5   Especially preferred compounds of formula III include those wherein:

(1) X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, X^3 represents $CR^7(R^8)(R^9)$, X^4 represents $CR^{10}(R^{11})(R^{12})$,

10   wherein each of R^1 to R^{12} independently represents unsubstituted C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^1 to R^{12} is identical, especially where each of R^1 to R^{12} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

15   A_1 and A_2 are the same and represent $-CH_2-$;

K^1, D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

Q^1 and Q^2 both represent phosphorus;

M represents Fe;

20   n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(2) X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$,

25   X^3 represents $CR^7(R^8)(R^9)$, X^4 represents $CR^{10}(R^{11})(R^{12})$;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 represents $CR^{13}(R^{14})(R^{15})$ and X^6 represents $CR^{16}(R^{17})(R^{18})$;

each of R^1 to R^{18} independently represent unsubstituted C_1-C_6 alkyl or trifluoromethyl,

30   particularly where each of R^1 to R^{18} is identical, especially where each of R^1 to R^{18} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

48

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(3) X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, X^3 represents $CR^7(R^8)(R^9)$, X^4 represents $CR^{10}(R^{11})(R^{12})$;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 represents $CR^{13}(R^{14})(R^{15})$ and X^6 represents $CR^{16}(R^{17})(R^{18})$;

each of R^1 to R^{18} independently represent unsubstituted C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^1 to R^{18} is identical, especially where each of R^1 to R^{18} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(4) X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, X^3 represents $CR^7(R^8)(R^9)$, X^4 represents $CR^{10}(R^{11})(R^{12})$, wherein each of R^1 to R^{12} independently represent unsubstituted C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^1 to R^{12} is identical,

especially where each of R^1 to R^{12} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1 and Q^2 both represent phosphorus;

K^1 represents hydrogen or C_1-C_6 alkyl, particularly hydrogen;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(5) X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, X^3 represents $CR^7(R^8)(R^9)$, X^4 represents $CR^{10}(R^{11})(R^{12})$;

E^1 represents $-CH_2-Q^5(X^9)X^{10}$ wherein X^9 represents $CR^{37}(R^{38})(R^{39})$ and X^{10} represents $CR^{40}(R^{41})(R^{42})$;

each of R^1 to R^{12} and R^{37} to R^{42} independently represent unsubstituted C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^1 to R^{12} and R^{37} to R^{42} is identical, especially where each of R^1 to R^{12} and R^{37} to R^{42} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^5 each represent phosphorus;

D^1 and K^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(6) X^1 represents $CR^1(R^2)(R^3)$, X^2 represents $CR^4(R^5)(R^6)$, X^3 represents $CR^7(R^8)(R^9)$, X^4 represents $CR^{10}(R^{11})(R^{12})$; K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 represents $CR^{13}(R^{14})(R^{15})$ and X^6 represents $CR^{16}(R^{17})(R^{18})$;

D^1 represents $-CH_2-Q^4(X^7)X^8$ wherein X^7 represents $CR^{31}(R^{32})(R^{33})$ and X^8 represents $CR^{34}(R^{35})(R^{36})$;

E^1 represents $-CH_2-Q^5(X^9)X^{10}$ wherein X^9 represents $CR^{37}(R^{38})(R^{39})$ and X^{10} represents $CR^{40}(R^{41})(R^{42})$;

each of R^1 to R^{18} and R^{31} to R^{42} independently represent unsubstituted C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^1 to R^{18} and R^{31} to R^{42} is identical, especially where each of R^1 to R^{18} and R^{31} to R^{42} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2, Q^3, Q^4 and Q^5 each represent phosphorus

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(7) X^1, X^2, X^3 and X^4 independently represent adamantyl, especially where X^1 to X^4 represent the same adamantyl group;

A_1 and A_2 are the same and represent $-CH_2-$;

K^1, D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

Q^1 and Q^2 both represent phosphorus;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(8) X^1, X^2, X^3 and X^4 independently represent adamantyl, especially where X^1 to X^4 represent the same adamantyl group;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 independently represent adamantyl, especially where X^1 to X^6 represent the same adamantyl group;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(9) X^1, X^2, X^3 and X^4 independently represent adamantyl, especially where X^1 to X^4 represent the same adamantyl group;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 independently represent adamantyl, especially where X^1 to X^6 represent the same adamantyl group;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(10) X^1, X^2, X^3 and X^4 independently represent adamantyl, especially where X^1 to X^4 represent the same adamantyl group;

A$_1$ and A$_2$ are the same and represent $-CH_2-$;

Q^1 and Q^2 both represent phosphorus;

K^1 represents hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L$_1$ represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(11) X^1, X^2, X^3 and X^4 independently represent adamantyl;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 independently represent adamantyl;

D^1 represents $-CH_2-Q^4(X^7)X^8$ wherein X^7 and X^8 independently represents adamantyl;

E^1 represents $-CH_2-Q^5(X^9)X^{10}$ wherein X^9 and X^{10} independently represents adamantyl, especially where X^1 to X^{10} represent the same adamantyl group;

A$_1$ and A$_2$ are the same and represent $-CH_2-$;

Q^1, Q^2, Q^3, Q^4 and Q^5 each represent phosphorus;

M represents Fe;

n = 1 and L$_1$ represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(12) X^1 and X^2 together with Q^2 to which they are attached represents 2-phospha-adamantyl;

X^3 and X^4 together with Q^1 to which they are attached represents 2-phospha-adamantyl;

A_1 and A_2 are the same and represent $-CH_2-$;

K^1, D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

Q^1 and Q^2 both represent phosphorus;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(13) X^1 and X^2 together with Q^2 to which they are attached represents 2-phospha-adamantyl;

X^3 and X^4 together with Q^1 to which they are attached represents 2-phospha-adamantyl;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 together with Q^3 to which they are attached represents 2-phospha-adamantyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(14) X^1 and X^2 together with Q^2 to which they are attached represents 2-phospha-adamantyl;

X^3 and X^4 together with Q^1 to which they are attached represents 2-phospha-adamantyl;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 together with Q^3 to which they are attached represents 2-phospha-adamantyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

$n = 1$ and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and $m = 0$.

(15) X^1 and X^2 together with Q^2 to which they are attached represents 2-phospha-adamantyl;

X^3 and X^4 together with Q^1 to which they are attached represents 2-phospha-adamantyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1 and Q^2 both represent phosphorus;

K^1 represents hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

$n = 1$ and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and $m = 0$.

(16) X^1 and X^2 together with Q^2 to which they are attached represents 2-phospha-adamantyl;

X^3 and X^4 together with Q^1 to which they are attached represents 2-phospha-adamantyl;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 together with Q^3 to which they are attached represents 2-phospha-adamantyl;

D^1 represents $-CH_2-Q^4(X^7)X^8$ wherein X^7 and X^8 together with Q^4 to which they are attached represents 2-phospha-adamantyl;

E^1 represents $-CH_2-Q^5(X^9)X^{10}$ wherein X^9 and X^{10} together with Q^5 to which they are attached represents 2-phospha-adamantyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2, Q^3, Q^4 and Q^5 each represent phosphorus

M represents Fe;

$n = 1$ and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and $m = 0$.

(17) X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa, X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb, wherein Y^1 and Y^2 both represent oxygen, R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

A_1 and A_2 are the same and represent $-CH_2-$;

K^1, D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

Q^1 and Q^2 both represent phosphorus;

M represents Fe;

$n = 1$ and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl (referred to as puc) and $m = 0$.

(18) X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa, X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb, wherein Y^1 and Y^2 both represent oxygen, R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 together with Q^3 to which they are attached form a ring system of formula IIIc, wherein Y^3 represents oxygen, R^{50} to R^{53} are independently selected from hydrogen, unsubstituted C_1-C_6 alkyl or CF_3 and R^{49} and R^{54} represent hydrogen;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 are the same and represent hydrogen or C_1-C_6 alkyl, particularly hydrogen;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(19) X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa, X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb, wherein Y^1 and Y^2 both represent oxygen, R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 together with Q^3 to which they are attached form a ring system of formula IIIc, wherein Y^3 represents oxygen, R^{50} to R^{53} are independently selected from

unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(20) X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa, X^3 and X^4 together with Q^1 to which they are attached form a ring system of formula IIIb, wherein Y^1 and Y^2 both represent oxygen, R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1 and Q^2 both represent phosphorus;

K^1 represents hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(21) X^1 and X^2 together with Q^2 to which they are attached form a ring system of formula IIIa, X^3 and X^4

58

together with Q^1 to which they are attached form a ring system of formula IIIb, wherein Y^1 and Y^2 both represent oxygen, R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 together with Q^3 to which they are attached form a ring system of formula IIIc, wherein Y^3 represents oxygen, R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

D^1 represents $-CH_2-Q^4(X^7)X^8$ wherein X^7 and X^8 together with Q^4 to which they are attached form a ring system of formula IIIc, wherein Y^3 represents oxygen, R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

E^1 represents $-CH_2-Q^5(X^9)X^{10}$ wherein X^9 and X^{10} together with Q^5 to which they are attached form a ring system of formula IIIe, wherein Y^5 represents oxygen, and R^{50} to R^{53} are independently selected from unsubstituted C_1-C_6 alkyl or CF_3, and R^{49} and R^{54} represent hydrogen;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2, Q^3, Q^4 and Q^5 each represent phosphorus;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl; particularly unsubstituted cyclopentadienyl, and m = 0.

(22) X^1, X^2, X^3 and X^4 independently represent congressyl, especially where X^1 to X^4 represent the same congressyl group;

59

A_1 and A_2 are the same and represent $-CH_2-$;

K^1, D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

Q^1 and Q^2 both represent phosphorus;

5   M represents Fe;

n   =   1   and L_1 represents   cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

10   (23) X^1, X^2, X^3 and X^4 independently represent congressyl, especially where X^1 to X^4 represent the same congressyl group;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 independently represent congressyl, especially where

15   X^1 to X^6 represent the same congressyl group;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

20   M represents Fe;

n   =   1   and L_1 represents   cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

25   (24) X^1, X^2, X^3 and X^4 independently represent congressyl, especially where X^1 to X^4 represent the same congressyl group;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 independently represent congressyl, especially where

30   X^1 to X^6 represent the same congressyl group;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

5   n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(25) X^1, X^2, X^3 and X^4 independently represent congressyl,

10   especially where X^1 to X^4 represent the same congressyl group;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1 and Q^2 both represent phosphorus;

K^1 represents hydrogen or unsubstituted C_1-C_6 alkyl,

15   particularly hydrogen;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

20   n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(26) X^1, X^2, X^3 and X^4 independently represent congressyl;

25   K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 and X^6 independently represent congressyl;

D^1 represents $-CH_2-Q^4(X^7)X^8$ wherein X^7 and X^8 independently represents congressyl;

E^1 represents $-CH_2-Q^5(X^9)X^{10}$ wherein X^9 and X^{10}

30   independently represents congressyl, especially where X^1 to X^{10} represent the same congressyl group;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2, Q^3, Q^4 and Q^5 each represent phosphorus;

61

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl,
particularly unsubstituted cyclopentadienyl, and m =
0.

(27) X^1 and X^3 independently represent adamantyl,
especially where X^1 and X^3 represent the same
adamantyl group;

X^2 represents $CR^4(R^5)(R^6)$ and X^4 represents
$CR^{10}(R^{11})(R^{12})$ wherein each of R^4, R^5, R^6, R^{10}, R^{11} and
R^{12} independently represent C_1-C_6 alkyl or
trifluoromethyl, particularly where each of R^4 to R^6
and R^{10} to R^{12} is identical, especially where each of
R^4 to R^6 and R^{10} to R^{12} represents unsubstituted C_1-C_6
alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

K^1, D^1 and E^1 are the same and represent hydrogen or
unsubstituted C_1-C_6 alkyl, particularly hydrogen;

Q^1 and Q^2 both represent phosphorus;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl,
particularly unsubstituted cyclopentadienyl, and m =
0.

(28) X^1 and X^3 independently represent adamantyl,
especially where X^1 and X^3 represent the same
adamantyl group;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 represents
adamantyl, especially where X^1, X^3 and X^5 represent
the same adamantyl group;

X^2 represents $CR^4(R^5)(R^6)$, X^4 represents $CR^{10}(R^{11})(R^{12})$,
X^6 represents $CR^{16}(R^{17})(R^{18})$, wherein each of R^4 to R^6,
R^{10} to R^{12} and R^{16} to R^{18} independently represent

unsubstituted C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^4 to R^6, R^{10} to R^{12}, and R^{16} to R^{18} is identical, especially where each of R^4 to R^6, R^{10} to R^{12} and R^{16} to R^{18} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 are the same and represent hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(29) X^1 and X^3 independently represent adamantyl, especially where X^1 and X^3 represent the same adamantyl group;

K^1 represents $-CH_2-Q^3(X^5)X^6$ wherein X^5 represents adamantyl, especially where X^1, X^3 and X^5 represent the same adamantyl group;

X^2 represents $CR^4(R^5)(R^6)$, X^4 represents $CR^{10}(R^{11})(R^{12})$, X^6 represents $CR^{16}(R^{17})(R^{18})$, wherein each of R^4 to R^6, R^{10} to R^{12} and R^{16} to R^{18} independently represent unsubstituted C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^4 to R^6, R^{10} to R^{12}, and R^{16} to R^{18} is identical, especially where each of R^4 to R^6, R^{10} to R^{12} and R^{16} to R^{18} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1, Q^2 and Q^3 each represent phosphorus;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

(30) X^1 and X^3 independently represent adamantyl, especially where X^1 and X^3 represent the same adamantyl group;

X^2 represents $CR^4(R^5)(R^6)$ and X^4 represents $CR^{10}(R^{11})(R^{12})$ wherein each of R^4, R^5, R^6, R^{10}, R^{11} and R^{12} independently represent C_1-C_6 alkyl or trifluoromethyl, particularly where each of R^4 to R^6 and R^{10} to R^{12} is identical, especially where each of R^4 to R^6 and R^{10} to R^{12} represents unsubstituted C_1-C_6 alkyl, particularly methyl;

A_1 and A_2 are the same and represent $-CH_2-$;

Q^1 and Q^2 both represent phosphorus;

K^1 represents hydrogen or unsubstituted C_1-C_6 alkyl, particularly hydrogen;

D^1 and E^1 together with the carbon atoms of the cyclopentadienyl ring to which they are attached form an unsubstituted phenyl ring;

M represents Fe;

n = 1 and L_1 represents cyclopentadienyl, particularly unsubstituted cyclopentadienyl, and m = 0.

Specific but non-limiting examples of bidentate ligands within this embodiment include the following: 1,2-bis-(dimethylaminomethyl)ferrocene, 1,2-bis-(ditertbutylphosphinomethyl)ferrocene, 1-hydroxymethyl-2-dimethylaminomethylferrocene, 1,2-bis-(ditertbutylphosphinomethyl)ferrocene, 1-hydroxymethyl-

2,3-bis-(dimethylaminomethyl)ferrocene,   1,2,3-tris-
(ditertbutylphosphinomethyl)ferrocene,   1,2-bis-
(dicyclohexylphosphinomethyl)ferrocene,   1,2-bis-(di-iso-
butylphosphinomethyl)ferrocene,   1,2-bis-
5   (dicyclopentylphosphinomethyl)ferrocene,   1,2-bis-
(diethylphosphinomethyl)ferrocene,   1,2-bis(di-
isopropylphosphinomethyl)ferrocene,   1,2-bis-
(dimethylphosphinomethyl)ferrocene,   1,2-bis-(di-(1,3,5,7-
tetramethyl-6,9,10-trioxa-2-phospha-
10   adamantylmethyl))ferrocene,   1,2-bis-
(dimethylaminomethyl)ferrocene-bismethyl   iodide,   1,2-
bis(dihydroxymethylphosphinomethyl)ferrocene,   1,2-
bis(diphosphinomethyl)ferrocene, 1,2-bis-α,α-(P-(2,2,6,6,-
tetramethylphosphinan-4-one))dimethylferrocene, and 1,2-
15   bis-(di-1,3,5,7-tetramethyl-6,9,10-trioxa-2-phospha-
adamantylmethyl))benzene.   Nevertheless,   the   skilled
person in the art would appreciate that other bidentate
ligands can be envisaged without departing from the scope
of the invention.

20

According to a further aspect, the present invention
provides a catalyst system capable of catalysing the
carbonylation of an ethylenically unsaturated compound,
said system comprising:

25

a)   a metal of Group VIB or Group VIIIB or a compound
thereof,
b)   a bidentate phosphine, arsine, or stibine ligand,
preferably a bidentate phosphine ligand, and
30   c)   an acid,

wherein said ligand is present in at least a 2:1 molar
excess compared to said metal or said metal in said metal

compound, and that said acid is present in at least a 2:1 molar excess compared to said ligand.

For the avoidance of any doubt, it is hereby stated that any of the features and embodiments described hereinbefore are equally applicable to this aspect.

According to a further aspect, the present invention provides a process for the carbonylation of an ethylenically unsaturated compound comprising contacting an ethylenically unsaturated compound with carbon monoxide and a hydroxyl group containing compound in the presence of a catalyst system as defined in the present invention, such as defined in the first aspect of the present invention. Preferably, the process is a liquid phase continuous process comprising the step noted above. Nevertheless, although the process is preferably operated continuously, batch operation is possible.

According to a yet further aspect, the present invention provides a process for the carbonylation of an ethylenically unsaturated compound comprising contacting an ethylenically unsaturated compound with carbon monoxide and a hydroxyl group containing compound in the presence of a catalyst system, said system comprising:

a) a metal of Group VIB or Group VIIIB or a compound thereof,
b) a bidentate phosphine, arsine, or stibine ligand, preferably a bidentate phosphine ligand, and
c) an acid,

wherein said ligand is present in at least a 2:1 molar excess compared to said metal or said metal in said metal compound, and that said acid is present in at least a 2:1 molar excess compared to said ligand.

Suitably, the hydroxyl group containing compound includes water or an organic molecule having a hydroxyl functional group. Preferably, the organic molecule having a hydroxyl functional group may be branched or linear, and comprises an alkanol, particularly a C_1-C_{30} alkanol, including aryl alkanols, which may be optionally substituted with one or more substituents selected from lower alkyl, aryl, Het, halo, cyano, nitro, OR^{19}, $OC(O)R^{20}$, $C(O)R^{21}$, $C(O)OR^{22}$, $NR^{23}R^{24}$, $C(O)NR^{25}R^{26}$, $C(S)R^{25}R^{26}$, SR^{27} or $C(O)SR^{28}$ as defined herein. Highly preferred alkanols are C_1-C_8 alkanols such as methanol, ethanol, propanol, iso-propanol, iso-butanol, t-butyl alcohol, n-butanol, phenol and chlorocapryl alcohol. Although the monoalkanols are most preferred, poly-alkanols, preferably, selected from di-octa ols such as diols, triols, tetra-ols and sugars may also be utilised. Typically, such polyalkanols are selected from 1, 2-ethanediol, 1,3-propanediol, glycerol, 1,2,4 butanetriol, 2-(hydroxymethyl)-1,3-propanediol, 1,2,6 trihydroxyhexane, pentaerythritol, 1,1,1 tri(hydroxymethyl)ethane, nannose, sorbase, galactose and other sugars. Preferred sugars include sucrose, fructose and glucose. Especially preferred alkanols are methanol and ethanol. The most preferred alkanol is methanol.

The amount of alcohol is not critical. Generally, amounts are used in excess of the amount of ethylenically unsaturated compound to be carbonylated. Thus the alcohol

may serve as the reaction solvent as well, although, if desired, separate solvents may also be used.

It will be appreciated that the end product of the reaction is determined at least in part by the source of hydroxyl group containing compound used. If water is used as the hydroxyl group containing compound then the end product is the corresponding carboxylic acid, whereas use of an alkanol produces the corresponding ester.

It will also be appreciated that the process of the present invention may start with a catalyst system having components providing molar ratios above or below those claimed but such ratios will progress to values within said ranges claimed during the course of the reaction.

It will of course also be appreciated that the levels of such components present within the catalyst system may change during the process of the invention as further amounts of some or all of the components are added to maintain the usable levels of components within the catalyst system. Some of the components of the catalyst system may drop out of the system during the reaction process and therefore levels may need to be topped-up to maintain levels within the actual catalyst system.

As stated hereinbefore, it will be appreciated by those skilled in the art that the phosphines described herein may function as ligands that coordinate with the Group VIB or Group VIIIB metal or compound, together with the present acid, to form a complex. This complex may represent part of the effective catalyst in the present

invention and hence may represent part of the catalyst system defined herein.

Thus, in a further aspect, the present invention provides
5 a complex capable of catalysing the carbonylation of an ethylenically unsaturated compound, said complex obtainable by combining:

a) a metal of Group VIB or Group VIIIB or a compound
10 thereof,
    b) a bidentate phosphine, arsine, or stibine ligand, preferably a bidentate phosphine ligand, and
    c) an acid,

15 wherein said ligand is present in at least a 2:1 molar excess compared to said metal or said metal in said metal compound, and that said acid is present in at least a 2:1 molar excess compared to said ligand.

20 In a yet further aspect, the present invention provides a process for the carbonylation of an ethylenically unsaturated compound with carbon monoxide and a hydroxyl group containing compound in the presence of a complex, said complex as defined above.
25

In the process according to the present invention, the carbon monoxide may be used in pure form or diluted with an inert gas such as nitrogen, carbon dioxide or a noble gas such as argon. Small amounts of hydrogen, typically
30 less than 5% by volume, may also be present.

The ratio (volume/volume) of ethylenically unsaturated compound to hydroxyl group containing compound may vary

between wide limits and suitably lies in the range of 1:0.1 to 1:10, preferably from between 2:1 to 1:2 and up to a large excess of hydroxyl group containing compounds when the latter is also the reaction solvent such as up to

5   a 50:1 excess of hydroxyl group containing compounds.

The molar ratio of the ethylenically unsaturated compound to carbon monoxide is preferably in the range 1:1 to 100:1 more preferably greater than 1:1, even more preferably at

10   least 3:1, especially from 3:1 to 50:1, and most preferably in the range from 3:1 to 15:1.

The amount of the catalyst of the invention used in the carbonylation process of the ethylenically unsaturated

15   compound is not critical. Good results may be obtained when, preferably, the amount of Group VIB or VIIIB metal is in the range 10^{-7} to 10^{-1} moles per mole of ethylenically unsaturated compound, more preferably, 10^{-6} to 10^{-2} moles, most preferably 10^{-5} to 10^{-2} moles per mole

20   of ethylenically unsaturated compound. Preferably, the amount of bidentate compound of formula I or formula III to unsaturated compound is in the range 10^{-7} to 10^{-1}, more preferably, 10^{-6} to 10^{-2}, most preferably, 10^{-5} to 10^{-2} moles per mole of ethylenically unsaturated compound.

25

Suitably, although non-essential to the invention, the carbonylation of an ethylenically unsaturated compound as defined herein may be performed in one or more aprotic solvents. Suitable solvents include ketones, such as for

30   example methylbutylketone; ethers, such as for example anisole (methyl phenyl ether), 2,5,8-trioxanonane (diglyme), diethyl ether, dimethyl ether, tetrahydrofuran, diphenylether, diisopropylether and the dimethylether of

di-ethylene-glycol; esters, such as for example
methylacetate, dimethyladipate methyl benzoate, dimethyl
phthalate and butyrolactone; amides, such as for example
dimethylacetamide, N-methylpyrrolidone and dimethyl
5   formamide; sulfoxides and sulphones, such as for example
dimethylsulphoxide, di-isopropylsulphone, sulfolane
(tetrahydrothiophene-2,2-dioxide), 2-methylsulfolane,
diethyl sulphone, tetrahydrothiophene 1,1-dioxide and 2-
methyl-4-ethylsulfolane; aromatic compounds, including
10 halo variants of such compounds eg. benzene, toluene,
ethyl benzene o-xylene, m-xylene, p-xylene, chlorobenzene,
o-dichlorobenzene, m-dichlorobenzene: alkanes, including
halo variants of such compounds eg, hexane, heptane,
2,2,3-trimethylpentane, methylene chloride and carbon
15 tetrachloride; nitriles eg. benzonitrile and acetonitrile.

Very suitable are aprotic solvents having a dielectric
constant that is below a value of 50, more preferably in
the range of 3 to 8, at 298.15 K and $1 \times 10^5 Nm^{-2}$. In the
20 present context, the dielectric constant for a given
solvent is used in its normal meaning of representing the
ratio of the capacity of a condenser with that substance
as dielectric to the capacity of the same condenser with a
vacuum for dielectric. Values for the dielectric constants
25 of common organic liquids can be found in general
reference books, such as the Handbook of Chemistry and
Physics, 76th edition, edited by David R. Lide et al, and
published by CRC press in 1995, and are usually quoted for
a temperature of about 20°C or 25°C, i.e. about 293.15k or
30 298.15 K, and atmospheric pressure, i.e. about $1 \times 10^5 Nm^{-2}$,
or can readily be converted to that temperature and
pressure using the conversion factors quoted. If no
literature data for a particular compound is available,

the dielectric constant may be readily measured using established physico-chemical methods.

For example, the dielectric constant of anisole is 4.3 (at 294.2 K), of diethyl ether is 4.3 (at 293.2 K), of sulfolane is 43.4 (at 303.2 K), of methylpentanoate is 5.0 (at 293.2 K), of diphenylether is 3.7 (at 283.2 K), of dimethyladipate is 6.8 (at 293.2 K), of tetrahydrofuran is 7.5 (at 295.2 K), of methylnonanoate is 3.9 (at 293.2 K). A preferred solvent is anisole.

If the hydroxyl group containing compound is an alkanol, an aprotic solvent will be generated by the reaction as the ester carbonylation product of the ethylenically unsaturated compound, carbon monoxide and the alkanol is an aprotic solvent.

The process may be carried out in an excess of aprotic solvent, i.e. at a ratio (v/v) of aprotic solvent to hydroxyl group containing compound of at least 1:1. Preferably, this ratio ranges from 1:1 to 10:1 and more preferably from 1:1 to 5:1. Most preferably the ratio (v/v) ranges from 1.5:1 to 3:1.

Despite the aforegoing it is preferred that the reaction is carried out in the absence of any external added aprotic solvent ie. an aprotic solvent not generated by the reaction itself.

The catalyst compounds of the present invention may act as a "heterogeneous" catalyst or a "homogeneous" catalyst.

72

By the term "homogeneous" catalyst we mean a catalyst, i.e. a compound of the invention, which is not supported but is simply admixed or formed in-situ with the reactants of the carbonylation reaction (e.g. the ethylenically

5   unsaturated compound, the hydroxyl containing compound and carbon monoxide), preferably in a suitable solvent as described herein.

By the term "heterogeneous" catalyst we mean a catalyst,

10   i.e. the compound of the invention, which is carried on a support.

Thus according to a further aspect, the present invention provides a process for the carbonylation of ethylenically

15   unsaturated compounds as defined herein wherein the process is carried out with the catalyst comprising a support, preferably an insoluble support.

Preferably, the support comprises a polymer such as a

20   polyolefin, polystyrene or polystyrene copolymer such as a divinylbenzene copolymer or other suitable polymers or copolymers known to those skilled in the art; a silicon derivative such as a functionalised silica, a silicone or a silicone rubber; or other porous particulate material

25   such as for example inorganic oxides and inorganic chlorides.

Preferably the support material is porous silica which has a surface area in the range of from 10 to 700 m^2/g, a

30   total pore volume in the range of from 0.1 to 4.0 cc/g and an average particle size in the range of from 10 to 500μm. More preferably, the surface area is in the range of from 50 to 500 m^2/g, the pore volume is in the range of from

0.5 to 2.5 cc/g and the average particle size is in the range of from 20 to 200 μm. Most desirably the surface area is in the range of from 100 to 400 m^2/g, the pore volume is in the range of from 0.8 to 3.0 cc/g and the

5   average particle size is in the range of from 30 to 100 μm. The average pore size of typical porous support materials is in the range of from 10 to 1000 Å. Preferably, a support material is used that has an average pore diameter of from 50 to 500 Å, and most desirably from

10   75 to 350 Å. It may be particularly desirable to dehydrate the silica at a temperature of from 100°C to 800°C anywhere from 3 to 24 hours.

Suitably, the support may be flexible or a rigid support,

15   the insoluble support is coated and/or impregnated with the compounds of the process of the invention by techniques well known to those skilled in the art.

Alternatively, the compounds of the process of the

20   invention are fixed to the surface of an insoluble support, optionally via a covalent bond, and the arrangement optionally includes a bifunctional spacer molecule to space the compound from the insoluble support.

25   The compounds of the invention may be fixed to the surface of the insoluble support by promoting reaction of a functional group present in the compound of formula I or III, for example a substituent K, D, Z and E (or K^1, D^1 and E^1) of the aryl moiety, with a complimentary reactive

30   group present on or previously inserted into the support. The combination of the reactive group of the support with a complimentary substituent of the compound of the invention provides a heterogeneous catalyst where the

compound of the invention and the support are linked via a
linkage such as an ether, ester, amide, amine, urea, keto
group.

5   The choice of reaction conditions to link a compound of
the process of the present invention to the support depend
upon the ethylenically unsaturated compound and the groups
of the support. For example, reagents such as
carbodiimides, 1,1'-carbonyldiimidazole, and processes
10   such as the use of mixed anhydrides, reductive amination
may be employed.

According to a further aspect, the present invention
provides the use of the process of any aspect of the
15   invention wherein the catalyst is attached to a support.

Conveniently, the process of the invention may be carried
out by dissolving the Group VIB or VIIIB metal or compound
thereof as defined herein in a suitable solvent such as
20   one of the hydroxyl group containing compounds or aprotic
solvents previously described (a particularly preferred
solvent would be the ester or acid product of the specific
carbonylation reaction e.g. Methyl propionate for ethylene
carbonylation) and subsequently admixing with a compound
25   of formula I or III as defined herein and an acid.

The carbon monoxide may be used in the presence of other
gases which are inert in the reaction. Examples of such
gases include hydrogen, nitrogen, carbon dioxide and the
30   noble gases such as argon.

Suitable Group VIB or VIIIB metals or a compound thereof
which may be combined with a compound of formula I or III

include cobalt, nickel, palladium, rhodium, platinum, chromium, molybdenum and tungsten, preferably include cobalt, nickel, palladium, rhodium and platinum. Preferably, component a) is a Group VIIIB metal or a compound thereof. Preferably, the metal is a Group VIIIB metal, such as palladium. Preferably, the Group VIIIB metal is palladium or a compound thereof. Thus, component a) is preferably palladium or a compound thereof. Suitable compounds of such Group VIB or VIIIB metals include salts of such metals with, or compounds comprising weakly coordinated anions derived from, nitric acid; sulphuric acid; lower alkanoic (up to C_{12}) acids such as acetic acid and propionic acid; sulphonic acids such as methane sulphonic acid, chlorosulphonic acid, fluorosulphonic acid, trifluoromethane sulphonic acid, benzene sulphonic acid, naphthalene sulphonic acid, toluene sulphonic acid, e.g. p-toluene sulphonic acid, t-butyl sulphonic acid, and 2-hydroxypropane sulphonic acid; sulphonated ion exchange resins; perhalic acid such as perchloric acid; ; halogenated carboxylic acids such as trichloroacetic acid and trifluoroacetic acid; orthophosphoric acid; phosphonic acids such as benzenephosphonic acid; and acids derived from interactions between Lewis acids and Broensted acids. Other sources which may provide suitable anions include the optionally halogenated tetraphenyl borate derivatives, e.g. perfluorotetraphenyl borate. Additionally, zero valent palladium complexes particularly those with labile ligands, e.g. triphenylphosphine or alkenes such as dibenzylideneacetone or styrene or tri(dibenzylideneacetone)dipalladium may be used. Nevertheless, an acid is present in the catalyst system as

set out hereinbefore, even if other sources of anion such as those noted above are also present.

Thus, the acid is selected from an acid having a pKa measured in aqueous solution at 18°C of less than 4, more
5   preferably less than 3, most preferably less than 2. Suitable acids include the acids listed supra. Preferably, the acid is not a carboxylic acid, more preferably the acid is either a sulphonic acid, or some other non-carboxylic acid such as those selected from the
10   list consisting of perchloric acid, phosphoric acid, methyl phosphonic acid, sulphuric acid, and sulphonic acids, even more preferably a sulphonic acid or other non-carboxylic acid (selected from the list above) having a pKa measured in aqueous solution at 18°C of less than 2,
15   yet even more preferably a sulphonic acid having a pKa measured in aqueous solution at 18°C of less than 2, still more preferably the acid is selected from the list consisting of the following sulphonic acids: methanesulphonic acid, trifluoromethanesulphonic acid,
20   tert-butanesulphonic acid, p-toluenesulphonic acid, 2-hydroxypropane-2-sulphonic acid, and 2,4,6-trimethylbenzenesulphonic acid, most preferably the acid is methanesulphonic acid.

As mentioned, the catalyst system of the present
25   invention may be used homogeneously or heterogeneously. Preferably, the catalyst system is used homogeneously.

The catalyst system of the present invention is preferably constituted in the liquid phase which may be formed by one or more of the reactants or by the use of a
30   suitable solvent.

The molar ratio of the amount of ethylenically unsaturated compound used in the reaction to the amount of

hydroxyl providing compound is not critical and may vary between wide limits, e.g. from 0.001:1 to 100:1 mol/mol.

5   The product of the carbonylation reaction using the ligand of the invention may be separated from the other components by any suitable means. However, it is an advantage of the present process that significantly fewer by-products are formed thereby reducing the need for further purification after the initial separation of the product as may be evidenced by the generally significantly

10   higher selectivity. A further advantage is that the other components which contain the catalyst system which may be recycled and/or reused in further reactions with minimal supplementation of fresh catalyst.

       Preferably, the carbonylation is carried out at a

15   temperature of between -10 to 150°C, more preferably 0°C to 140°C, even more preferably 15°C to 140°C, most preferably 20°C to 120°C. An especially preferred temperature is one chosen between 80°C to 120°C. Advantageously, the carbonylation can be carried out at

20   moderate temperatures, it is particularly advantageous to be able to carry out the reaction at room temperature (20°C).

       Preferably, when operating a low temperature carbonylation, the carbonylation is carried out between -

25   30°C to 49°C, more preferably, -10°C to 45°C, still more preferably 0°C to 45°C, even more preferably 10°C to 45°C, most preferably 15°C to 45°C. Especially preferred is a range of 15 to 35°C.

30   Preferably, the carbonylation is carried out at a CO partial pressure of between 0.80×10^5 N.m^{-2}–90×10^5N.m^{-2}, more preferably 1×10^5 N.m^{-2}–65×10^5N.m^{-2}, most preferably

78

$1-30 \times 10^5$ N.m^{-2}.   Especially preferred is a CO partial pressure of 5 to 20×10^5N.m^{-2}.

Preferably, a low pressure carbonylation is also
5   envisaged.   Preferably, when operating a low pressure carbonylation the carbonylation is carried out at a CO partial pressure of between 0.1 to 5×10^5N.m^{-2}, more preferably 0.2 to 2×10^5N.m^{-2}, most preferably 0.5 to 1.5 $\times 10^5$N.m^{-2}.
10

The ethylenically unsaturated compounds may be substituted or non-substituted with groups as defined above for the "aryl" group above.   Particularly suitable substituents include alkyl and aryl groups as well as groups containing
15   heteroatoms such as halides, sulphur, phosphorus, oxygen and nitrogen.   Examples of substituents include chloride, bromide, iodide and hydroxy, alkoxy, carboxy, amino, amido, nitro, cyano, thiol or thioalkoxy groups.   Suitable ethylenically unsaturated compounds include ethene,
20   propene, hexene, vinyl compounds such as vinyl acetates, heptene, octene, nonene, decene, undecene, dodecene, etc up to C_{30}, i.e. having from 2 to 30 carbon atoms, which may be linear or branched, cyclic or uncyclic or part cyclic and in which the double bond may take any suitable
25   position in the carbon chain and which includes all stereisomers thereof.

Moreover, the unsaturated compound may have one or more unsaturated bonds and therefore, for example, the range of
30   ethylenically unsaturated compounds extends to dienes. The unsaturated bond(s) may be internal or terminal, the catalyst system of the invention being particularly advantageous in the conversion of internal olefins.

Particularly preferred are olefins having from 2 to 22 carbon atoms per molecule, such as ethene, propene, 1-butene, 2-butene, isobutene, pentenes, hexenes, octenes, e.g. oct-2-ene, oct-3-ene, oct-4-ene, decenes and dodecenes, triisobutylene, tripropylene, internal C_{14} olefins, and internal C_{15}-C_{18} olefins, 1,5-cyclooctadiene, cyclododecene, methyl pentenoate and pentene nitriles, e.g. pent-2-ene nitrile.

The ethylenically unsaturated compound is preferably an alkene having 1 to 3 carbon-carbon double bonds per molecule. Non-limiting examples of suitable dienes include the following: 1,3-butadiene, 2-methyl-1,3-butadiene, 1,5-cyclooctadiene, 1,3-cyclohexadiene, 2,4-heptadiene, 1,3-pentadiene, 1,3-hexadiene, particularly 1,3-butadiene.

Another preferred category of unsaturated compounds consists of unsaturated esters of carboxylic acids and esters of unsaturated carboxylic acids. For example, the starting material may be a vinyl ester of a carboxylic acid such as acetic acid or propanoic acid, or it may be an alkyl ester of an unsaturated acid, such as the methyl or ethyl ester of acrylic acid or methacrylic acid.

A further preferred category of unsaturated compounds consists of cycloalkadienes, which will ordinarily refuse carbonylation. For example, the starting material may be dicyclopentadiene or norbornadiene, to give diesters, diamides or diacids, etc., which may find subsequent use as monomers in polymerisation reactions.

The use of stabilising compounds with the catalyst system may also be beneficial in improving recovery of metal which has been lost from the catalyst system. When the catalyst system is utilized in a liquid reaction medium

5   such stabilizing compounds may assist recovery of the Group VI or VIIIB metal.

Preferably, therefore, the catalyst system includes in a liquid reaction medium a polymeric dispersant dissolved in

10   a liquid carrier, said polymeric dispersant being capable of stabilising a colloidal suspension of particles of the Group VI or VIIIB metal or metal compound of the catalyst system within the liquid carrier.

15   The liquid reaction medium may be a solvent for the reaction or may comprise one or more of the reactants or reaction products themselves. The reactants and reaction products in liquid form may be miscible with or dissolved in a solvent or liquid diluent.

20

The polymeric dispersant is soluble in the liquid reaction medium, but should not significantly increase the viscosity of the reaction medium in a way which would be detrimental to reaction kinetics or heat transfer. The

25   solubility of the dispersant in the liquid medium under the reaction conditions of temperature and pressure should not be so great as to deter significantly the adsorption of the dispersant molecules onto the metal particles.

30   The polymeric dispersant is capable of stabilising a colloidal suspension of particles of said Group VI or VIIIB metal or metal compound within the liquid reaction medium such that the metal particles formed as a result of

catalyst degradation are held in suspension in the liquid reaction medium and are discharged from the reactor along with the liquid for reclamation and optionally for re-use in making further quantities of catalyst. The metal

5   particles are normally of colloidal dimensions, e.g. in the range 5 - 100 nm average particle size although larger particles may form in some cases. Portions of the polymeric dispersant are adsorbed onto the surface of the metal particles whilst the remainder of the dispersant

10   molecules remain at least partially solvated by the liquid reaction medium and in this way the dispersed Group VI or VIIIB metal particles are stabilised against settling on the walls of the reactor or in reactor dead spaces and against forming agglomerates of metal particles which may

15   grow by collision of particles and eventually coagulate. Some agglomeration of particles may occur even in the presence of a suitable dispersant but when the dispersant type and concentration is optimised then such agglomeration should be at a relatively low level and the

20   agglomerates may form only loosely so that they may be broken up and the particles redispersed by agitation.

The polymeric dispersant may include homopolymers or copolymers including polymers such as graft copolymers and

25   star polymers.

Preferably, the polymeric dispersant has sufficiently acidic or basic functionality to substantially stabilise the colloidal suspension of said Group VI or VIIIB metal

30   or metal compound.

By substantially stabilise is meant that the precipitation of the Group VI or VIIIB metal from the solution phase is substantially avoided.

5   Particularly preferred dispersants for this purpose include acidic or basic polymers including carboxylic acids, sulphonic acids, amines and amides such as polyacrylates or heterocycle, particularly nitrogen heterocycle, substituted polyvinyl polymers such as
10   polyvinyl pyrrolidone or copolymers of the aforesaid.

Examples of such polymeric dispersants may be selected from polyvinylpyrrolidone, polyacrylamide, polyacrylonitrile, polyethylenimine, polyglycine,
15   polyacrylic acid, polymethacrylic acid, poly(3-hydroxybutyricacid), poly-L-leucine, poly-L-methionine, poly-L-proline, poly-L-serine, poly-L-tyrosine, poly(vinylbenzenesulphonic acid) and poly(vinylsulphonic acid).

20

Preferably, the polymeric dispersant incorporates acidic or basic moieties either pendant or within the polymer backbone. Preferably, the acidic moieties have a dissociation constant (pK_a) of less than 6.0, more
25   preferably, less than 5.0, most preferably less than 4.5. Preferably, the basic moieties have a base dissociation constant (pK_b) being of less than 6.0, more preferably less than 5.0 and most preferably less than 4.5, pK_a and pK_b being measured in dilute aqueous solution at 25°C.

30

Suitable polymeric dispersants, in addition to being soluble in the reaction medium at reaction conditions, contain at least one acidic or basic moiety, either within

the polymer backbone or as a pendant group. We have found that polymers incorporating acid and amide moieties such as polyvinylpyrollidone (PVP) and polyacrylates such as polyacrylic acid (PAA) are particularly suitable. The

5   molecular weight of the polymer which is suitable for use in the invention depends upon the nature of the reaction medium and the solubility of the polymer therein. We have found that normally the average molecular weight is less than 100,000. Preferably, the average molecular weight is

10   in the range 1,000 - 200,000, more preferably, 5,000 - 100,000, most preferably, 10,000 - 40,000 e.g. Mw is preferably in the range 10,000 - 80,000, more preferably 20,000 - 60,000 when PVP is used and of the order of 1,000 - 10,000 in the case of PAA.

15

The effective concentration of the dispersant within the reaction medium should be determined for each reaction/catalyst system which is to be used.

20   The dispersed Group VI or VIIIB metal may be recovered from the liquid stream removed from the reactor e.g. by filtration and then either disposed of or processed for re-use as a catalyst or other applications. In a continuous process the liquid stream may be circulated

25   through an external heat-exchanger and in such cases it may be convenient to locate filters for the palladium particles in these circulation apparatus.

Preferably, the polymer:metal mass ratio in g/g is between

30   1:1 and 1000:1, more preferably, between 1:1 and 400:1, most preferably, between 1:1 and 200:1. Preferably, the polymer:metal mass ratio in g/g is up to 1000, more preferably, up to 400, most preferably, up to 200.

According to a further aspect there is provided a reaction medium comprising one or more reactants, and a catalyst system comprising, or obtainable by combining, at least a

5   Group VIB or VIIIB metal or metal compound, a bidentate phosphine, arsine, or stibine ligand, and an acid, as defined herein, wherein said ligand is present in at least a 2:1 molar excess compared to said metal or said metal in said metal compound, and that said acid is present in at

10 least a 2:1 molar excess compared to said ligand.

Preferably, said reaction medium is a liquid-phase reaction medium, more preferably a liquid-phase continuous-system reaction system.

15 Preferably, within said reaction medium, the amount of free acid present in the medium, that is acid which is not directly combined with the phosphine ligand, is greater than 500ppm, more preferably greater than 1000ppm, most preferably greater than 2000ppm.

20 According to a further aspect the invention provides a process for preparing the catalyst systems of the invention comprising combining components a), b) and c) as defined herein, preferably in the aforementioned ratios.

According to a yet further aspect the present invention

25 provides the use of a system comprising, or obtainable by combining:

a) a metal of Group VIB or Group VIIIB or a compound thereof,

b) a bidentate phosphine, arsine, or stibine ligand,

30 preferably a bidentate phosphine ligand, and

c) an acid,

wherein said ligand is present in at least a 2:1 molar excess compared to said metal or said metal in said metal

compound, and that said acid is present in at least a 2:1 molar excess compared to said ligand, as a catalyst in the carbonylation of an ethylenically unsaturated compound, preferably the liquid-phase carbonylation of an

5 ethylenically unsaturated compound, more preferably the liquid-phase continuous-system carbonylation of an ethylenically unsaturated compound.

For the avoidance of any doubt, each and every feature
10 described hereinbefore is equally applicable to any or all of the various aspects of the present invention as set out herein, unless such features are incompatible with the particular aspect or are mutually exclusive.

15 All documents mentioned herein are incorporated by reference thereto.

The following examples further illustrate the present invention. These examples are to be viewed as being
20 illustrative of specific materials falling within the broader disclosure presented above and are not to be viewed as limiting the broader disclosure in any way.

Example 1
25 Preparation of 1,2 bis(diadamantylphosphinomethyl) benzene
1,2 bis(diadamantylphosphinomethyl) benzene

(Method 1)

The preparation of this ligand was carried out as follows.

5

1.1 Preparation of (1-Ad)$_2$P(O)Cl

Phosphorous trichloride (83 cm^3, 0.98 mol) was added rapidly via cannula to a combination of aluminium chloride 10 (25.0 g, 0.19 mol) and adamantane (27.2 g, 0.20 mol) affording a tan suspension. The reaction was heated to reflux. After 10 mins, a yellow-orange suspension was formed. The reaction was refluxed for a total of 6 h. The excess PCl$_3$ was removed by distillation at atmospheric 15 pressure (BP 75 °C). On cooling to ambient temperature, an orange solid was formed. Chloroform (250 cm^3) was added yielding an orange suspension, which was cooled to 0 °C. Water (150 cm^3) was added slowly: initially the suspension viscosity increased, but on full addition of water the

viscosity lessened. From this point the reaction was no longer kept under an atmosphere of Ar. The suspension was Buchner filtered to remove the yellow-orange solid impurity. The filtrate consisted of a two phase system. 5 The lower phase was separated using a separating funnel, dried over $MgSO_4$ and Buchner filtered. The volatiles were removed via rotary evaporation, drying finally in-vacuo, affording an off-white powder. Yield 35.0 g, 99 %. ^{31}P NMR: δ = 85 ppm, 99 % pure. FW = 352.85.

10

1.2 Preparation of (1-Ad)$_2$PH

$LiAlH_4$ (2.54 g, 67.0 mmol) was added over 90 minutes to a chilled (-10 °C) solution of (1-Ad)$_2$P(O)Cl (10.00 g, 28.3 15 mmol) in THF. (120 cm^3). The reaction was allowed to warm to ambient temperature then stirred for 20 h. The grey suspension was cooled to -10 °C. HCl (aq., 5 cm^3 c. HCl in 50 cm^3 degassed water) was added slowly via syringe (initially **very slowly** due to exotherm of reaction), 20 yielding a two phase system, with some solid material in the lower phase. Further HCl (~ 5 cm^3 c. HCl) was added to improve the separation of the layers. The upper phase was removed via flat ended cannula, dried over $MgSO_4$ and filtered via cannula. The volatiles were removed in-vacuo 25 affording the product as a white powder, isolated in the glovebox. Yield 6.00 g, 70 %. ^{31}P NMR: δ= 17 ppm, 100 % pure. FW = 302.44.

1.3 Preparation of (1-Ad)$_2$PCl

30

A solution of Ad$_2$PH (10.5 g, 34.7 mmol) and DBU (6.12 cm^3, 40.9 mmol) in toluene (250 cm^3) was chilled to -10 °C. Phosgene solution (30.0 cm^3, 56.7 mmol, was added slowly

via cannula, transferring via a measuring cylinder. This afforded a highly viscous pale yellow suspension. Additional toluene (100 cm^3) was added via cannula to lessen the viscosity and ease the stirring. The reaction

5   was filtered via cannula affording a yellow filtrate. The residue was washed with additional toluene (2 × 100 cm^3) and the washings combined with the original filtrate. The volatiles were removed *in-vacuo* affording a pale yellow solid, which was washed with pentane (2 × 30 cm^3, washings

10   practically colourless). The product was dried *in-vacuo* and isolated in the glovebox as a lemon yellow powder. Yield 7.84 g, 67 %. ^{31}P NMR: δ = 139 ppm, 99+ % pure. FW = 336.88.

15   **1.4 Preparation   of   1,2-bis(di-1-adamantylphosphinomethyl)benzene**

1.4.1   Preparation of DI-SODIO-ORTHO-XYLENE(DISOD)

20   Bu^{n}Li (2.5 M in hexanes, 11.28 cm^3, 28.2 mmol) was added dropwise via syringe over 15 minutes to a stirred suspension of NaOBu^t (crushed, 2.71 g, 28.2 mmol), o-xylene (1.15 cm^3, 9.4 mmol) and N,N,N′,N′ − tetramethyl ethylene diamine (TMEDA) (4.26 cm^3, 28.2 mmol) in heptane

25   (100 cm^3). The reaction was heated at 60 °C for 2 h, then allowed to cool / settle, affording a bright orange solid (DISOD) and pale yellow solution. The solution was removed via cannula filtration and the solid washed with additional heptane (50 cm^3) and dried *in-vacuo*. 90 % yield

30   assumed, 8.47 mmol.

1.4.2   Reaction of DI-SODIO-ORTHO-XYLENE with 2 equiv (1-Ad)$_2$PCl

A suspension of DISOD (8.47 mmol) in Et_2O (100 cm^3) was prepared at -78 °C. A suspension of Ad_2PCl (5.70 g, 16.9 mmol) in Et_2O (120 cm^3) was stirred rapidly at -78 °C and
5 added via wide-bore cannula to the DISOD suspension. The reaction was allowed to warm to ambient temperature and stirred for 18 h, affording a pale yellow turbid solution. Water (degassed, 100 cm^3) added via cannula affording a two phase system, with a great deal of white solid present
10 (product) due to the low solubility of this material. The upper phase (Et_2O) was removed via cannula. The solid in the aqueous phase was extracted using dichloromethane (200 cm^3), forming two clear phases. The lower phase (CH_2Cl_2) was removed via cannula and combined with the original
15 Et_2O phase. The volatiles were removed *in-vacuo* yielding a slightly sticky solid. The solid was washed with pentane (200 cm^3) with attrition being performed, the washings being removed via cannula filtration. The white solid was dried *in-vacuo* and isolated in the glovebox as a friable
20 white powder. Yield 3.5 g, 59 %. FW = 707.01.

^{31}P {^1H}NMR data:- δ 24 ppm.

^1H NMR data:- (400 MHz, $CDCl_3$, 298 K) δ 7.59-7.50 (m, 2H,
25 Ar-H), 7.09-6,99 (m, 2H, Ar-H), 3.01 (d, 4H, $^2J_{PH}$ = 3.2 Hz, CH_2), 2.07-1.57 (m, 60H, $C_{10}H_{15}$) ppm.

^{13}C {^1H} NMR data:- (100 MHz, $CDCl_3$, 298 K) δ 139.4 (dd, J_{PC} = 10.7 Hz, J_{PC} = 2.3 Hz, Ar-C), 131.0 (d, J_{PC} = 16.8 Hz,
30 Ar-C), 125.0 (s, Ar-C), 41.1 (d, $^2J_{PC}$ = 10.7 Hz, Ad-C^2), 37.2 (s, Ad-C^4), 36.9 (d, $^1J_{PC}$ = 22.9 Hz, Ad-C^1), 28.8 (d,

$^{3}J_{PC}$ = 7.6 Hz, Ad-C^{3}), 22.0 (dd, $^{1}J_{PC}$ = 22.9 Hz, $^{4}J_{PC}$ = 3.1 Hz, CH$_2$).

Example 2

5   Preparation of 1,2 bis(diadamantylphosphinomethyl) benzene (method 2)

2.1 Di-1-adamantyl phosphinic chloride was prepared in accordance with the method of Example 1.1.

10

2.2 Di-1-adamantyl phosphine was prepared in accordance with the method of Example 1.2.

2.3 (Di-1-adamantyl phosphine) trihydro boron. Borane

15   (THF) adduct (10 cm^3, 10mmol) was added to stirred solution of di-1-adamantyl phosphine (1.36g, 4.5mmol) in THF (30cm^3). Stirring for a further 5hrs afforded a slightly turbid solution. The volatiles were then removed in-vacuo to yield the product as a pure white solid.

20   Yield: 1.39g, 98%, 99% pure. FW: 315.25. ^{31}P NMR: δ 41ppm (d, J_{PB} 64 Hz).

2.4 Synthesis of 1,2 bis (di-1-adamantylphosphor(borane)methyl) benzene via deprotonation

25   **with ^{sec}BuLi and reaction with αα dichloro o-xylene.** To a stirred, cooled (–78°) THF solution (60cm^3) of di-1-adamantyl phosphine trihydroboron (5g,15.8mmol), was slowly added (via syringe) ^{sec}BuLi (12.3cm^3,16.6mmol), upon full addition the solution had a noticeable yellow

30   colouration. The solution was stirred for 30 minutes at –78° and then allowed to warm to room temperature and stir for a further 120 minutes. The solution was then cooled to

-78° and a THF solution (20cm^3) of αα dichloro o-xylene was added via cannula. The solution was then allowed to warm to room temperature and stirred for 15 hrs. The volatiles where then removed in-vacuo. No further work up was required as LiCl and excess organics are removed during the deprotection procedure.Yield: 100% 85% pure.

^{31}P {^{1}H} NMR (CDCl$_3$,298K) δ (d, br) 41 ppm.

^{11}B {^{1}H} NMR δ -43 ppm (d, J$_{BP}$ 44 Hz)

^{1}H NMR (CDCl$_3$, 298K) δ 7.8-7.50 ppm (m,br Ar-**H**), δ 7.49-7.00 ppm (m, br Ar-**H**), δ 3.3 ppm (d, **CH$_2$**), δ 2.2-1.2 ppm (m, C$_{10}$**H$_{15}$**)

2.5 Synthesis of 1,2-bis(di-adamantylphosphinomethyl)benzene via deprotection of 1,2 bis (di-adamantylphosphor(borane)methyl) benzene with HBF$_4$·O(ME)$_2$.

Tetrafluoroboric acid dimethyl ether complex (5 equivalents, 12.5mmols, 1.5cm^3) was added slowly via syringe to a cooled (0°c) stirred solution of 1,2 bis (di-adamantylphosphor(borane)methyl benzene (70 cm^3 dichloromethane). The solution was stirred at 0°c for 1 hour and then allowed to warm to ambient temperature and stir for a further 12 hours. The reaction mixture was then added to a cooled (0°c) saturated solution (degassed) NaHCO$_3$ solution (5* excess NaHCO$_3$) and stirred vigorously for 50 minutes. The organic phase was then extracted with 2*30 cm^3 portions of diethyl ether, and added to the DCM extract. The organic layers were then washed with 2 x 30 cm^3 portions of degassed water and dried over MgSO$_4$. The volatiles were then removed in-vacuo.
^{31}P {^{1}H} NMR:δ 26.4 ppm (s).

H^1 NMR (CDCl$_3$, 298K) δ 7.54 ppm (q, Ar-**H**, J$_{HH}$ 3.4 Hz), 7.0 ppm (q, Ar-**H**, J$_{HH}$ 3.4 Hz), 3.0 ppm (d, br CH$_2$) 1.6-2.1 ppm

5   (m,br C$_{10}$**H**$_{15}$).

Example 3
Preparation   of   1,2   bis   (di-3,5-dimethyladamantylphosphinomethyl) benzene (method 2)

10

1,2-bis(di-1-(3,5-dimethyl-adamantyl) phosphinomethyl) benzene

3.1 Di-1-(3,5-dimethyladamantyl) phosphinic chloride was prepared in accordance with the method of Example 2.1

15   except using 1,3 dimethyladamantane 21.7g (0.132 mol) instead of adamantane, and AlCl$_3$ (18.5gg, 0.14 mol). Yield 23.5g FW: 409.08.. ^{31}P NMR: δ: 87ppm (s).

3.2 Di-1-(3,5-dimethyladamantyl) phosphine was prepared

20   as per Example 2.2 above except using 25.0 g Di-1-(3,5-

93

dimethyladamantyl) phosphinic chloride instead of di-1-adamantyl phosphonic chloride   Yield 15.7 g   FW: 358.58..
^{31}P NMR: δ: 15.7ppm (s).

5   **3.3 Di-1-(3,5-dimethyladamantyl) phosphine} trihydro boron** was prepared as per Example 2.3 above except using 10.0 g Di-1-(3,5-dimethyladamantyl) phosphine instead of di-1-adamantyl phosphine. Yield 9.5 g ^{31}P NMR: δ: 40.5ppm (br).

10

3.4 Synthesis of 1,2 bis (di-3,5-dimethyladamantyl (borane)methyl) benzene via deprotonation with ^{sec}BuLi and reaction with αα dichloro o-xylene was prepared as per Example 2.4 above except using equimolar amounts of di-

15   3,5-dimethyl adamantyl phosphine trihydroboron instead of di-1-adamantyl phosphine trihydroboron.

3.5 Synthesis of 1,2 bis (di-3,5-dimethyladamantylphosphinomethyl) benzene via deprotection

20   **of 1,2 bis (di-3,5-dimethyladamantyl phosphor(borane)methyl) benzene with HBF$_4$·O(ME)$_2$** was prepared as per 1,2 bis (di-1-adamantylphosphinomethyl) benzene (Example 2.5) above except by using equimolar amounts of 1,2 bis(di-3,5-

25   dimethyadamantylphosphor(borane)methyl) benzene instead of 1,2 bis(di-adamantylphosphor(borane)methyl) benzene.

Example 4
Preparation of 1,2 bis (di-5-tert-

30   butyladamantylphosphinomethyl) benzene (method 2)
1,2-bis(di-1-(5-tert-butyl-adamantyl) phosphinomethyl) benzene

4.1 Di-1-(5-tert-butyladamantyl) phosphinic chloride was
prepared as per Di-1-adamantyl phosphinic chloride above
5   except using tert-butyladamantane 25.37g (0.132 mol)
instead of adamantane, and AlCl$_3$ (18.5gg, 0.14 mol).
Yield 22.6g FW: 464.98.. ^{31}P NMR: δ: 87ppm (s).

4.2.1 Di-1-(5-tert-butyladamantyl) phosphine was
10 prepared as per Di-1-adamantyl phosphine above except
using 13.5 g Di-1-(5-tert-butyladamantyl) phosphinic
chloride instead of di-1-adamantyl phosphinic chloride.
Yield 9.4 g FW: 414.48.. ^{31}P NMR: δ: 18.62ppm (s).

15 **4.2.2 Di-1-(5-tert-butyladamantyl) phosphine) trihydro
boron** was prepared as per Di-1-adamantyl phosphine above
except using 10.0 g Di-1-(5-tert-butyladamantyl) phosphine

·instead of di-1-adamantyl phosphine.   Yield 9.5 g ^{31}P

NMR: δ: 41.6ppm (br).

4.2.3   Synthesis   of   1,2   bis   (di-5-tert-
butyladamantylphosphor(borane)methyl)   benzene   via
deprotonation with ^{sec}BuLi and reaction with αα dichloro o-
xylene was   prepared   as   per   1,2   bis   (di-1-
adamantylphosphor(borane)methyl) benzene above except
using equimolar amounts of di-1-(5-tert-butyladamantyl)
phosphine   trihydroboron   instead   of   di-1-adamantyl
phosphine trihydroboron.

4.3 Synthesis   of   1,2   bis   (di-5-tert-
butyladamantylphosphinomethyl) benzene via deprotection of
1,2 bis (di-4-tert-butyladamantyl phosphor(borane)methyl)
benzene with HBF$_4$·O(ME)$_2$ was prepared as per 1,2 bis (di-1-
adamantylphosphinomethyl) benzene above except 1,2 bis(di-
5-tert-butyladamantylphosphor(borane)methyl)   benzene   was
used   instead   of   1,2   bis(di-
adamantylphosphor(borane)methyl)   benzene   in   equimolar
amounts.

Example 5
Preparation   of   1,2   bis(1-adamantyl   tert-butyl-
phosphinomethyl) benzene (method 2)

5.1. 1-adamantylphosphonic acid dichloride. This compound
was synthesised according to the method of Olah et al (J.
Org. Chem. 1990, 55, 1224-1227).

5.2 1-adamantyl phosphine. LiAlH$_4$ (3.5g,   74mmol)   was
added over 2   hrs to a cooled solution (0°C) of **1-**
adamantylphosphonic acid dichloride (15g, 59 mmol) in THF

(250 cm^3). The reaction was then allowed to warm to ambient temperature and was stirred for 20 hrs. The grey suspension was then cooled (0°C) and HCl (75 cm^3, 1M) was slowly added via syringe, to afford a two phase system

5   with some solid present in the lower phase. Concentrated HCl (8cm^3, 11M) was then added to improve the separation of the two layers. The (upper) THF phase was removed via cannula and dried over magnesium sulphate. After filtration via cannula, the volatiles were removed in-

10   vacuo to afford the product.

5.3 (1-adamantyl-tert-butyl phosphine) trihydro boron. nBuLi (20 cm^3, 32 mmol 1.6M soln) was added over 1 hour to a cooled solution of 1-adamantyl phosphine (5.0g 30 mmol)

15   in THF (100 cm^3). The solution was allowed to warm to room temperature and stirred for a further 2 hours. The solution was recooled to 0°C and tert-butylchloride (2.78g, 30 mmol) was added and stirring continued for a further 16 hours at room temperature. The material was

20   isolated as the borane adduct by addition of Borane (THF) adduct (30 cm^3, 30mmol) followed by removal of the solvent. The material was isolated as a white solid which was a mixture of isomers.

25   **5.4 Synthesis of 1,2 bis (1-adamantyl-tert-butyl phosphor (borane)methyl) benzene via deprotonation with ^{sec}BuLi and reaction with αα dichloro o-xylene.** The synthesis was carried out as per 1,2 bis (di-1-adamantylphosphor(borane)methyl) benzene above except

30   equimolar amounts of 1-adamantyl-tert-butyl(phosphine)trihydroboron were used instead of the di-1-adamantyl phosphine trihydroboron.

5.5 Synthesis of 1,2 bis (1-adamantyl-tert-butylphosphinomethyl) benzene via deprotection of 1,2 bis (1-adamantyl-tert-butyl phosphor(borane)methyl) benzene with HBF$_4$·O(ME)$_2$. As per 1,2 bis (di-adamantylphosphorinomethyl) benzene except using equimolar amounts of 1,2 bis(1-adamantyl-tert-butyl phosphor(borane)methyl) benzene instead of 1,2 bis)(di-adamantylphosphor(borane)methyl) benzene.

Example 6

Preparation of 1,2 bis(di-1-diamantanephosphinomethyl) benzene. Diamantane = congressane
1,2 bis(dicongressylphosphinomethyl) benzene

6.1 Diamantane. This was synthesised according to the method of Tamara et al. Organic Syntheses, CV 6, 378

6.2 Di-1-(diamantane) phosphinic chloride. Prepared as per Di-1-adamantyl phosphinic chloride except using

diamantane 20.0g (0.106 mol) and $AlCl_3$ (16.0g, 0.12 mol). Yield 25.5g FW: 456.5.. ^{31}P NMR: δ: 87ppm (s).

6.3 Di-1-(diamantane) phosphine. Prepared as per Di-1-adamantyl phosphine except using 25.0 g Di-1-(diamantane) phosphinic chloride. Yield 14.0 g FW: 406.. ^{31}P NMR: δ: 16.5ppm (s).

6.4 Di-1-(diamantane) phosphine} trihydro boron. Prepared as per Di-1-adamantyl phosphine trihydro boron except using 15.0 g **Di-1-(diamantane) phosphine.** Yield 14.5 g . ^{31}P NMR: δ: 42.1ppm (br).

6.5 Synthesis of 1,2 bis (diamantane phosphor(borane)methyl) benzene via deprotonation with $^{sec}BuLi$ and reaction with $\alpha\alpha$ dichloro o-xylene. Prepared as per 1,2 bis (di-1-adamantylphosphor(borane)methyl) benzene except using an equimolar amount of diamantane phosphine trihydroboron instead of di-1-adamantyl phosphine trihydroboron.

6.6 Synthesis of 1,2 bis (diamantanephosphinomethyl) benzene via deprotection of 1,2 bis (diamantane (borane)methyl) benzene with $HBF_4 \cdot O(ME)_2$. Prepared as per 1,2 bis (di-1-adamantylphosphino methyl) benzene except using an equimolar amount of 1,2 bis diamantine phosphor(borane)methyl) benzene instead of 1,2 bis(di-adamantylphosphor(borane)methyl) benzene.

Example 7

Preparation   of   1,2-bis-(ditertbutylphosphinomethyl) benzene
1,2-bis-(di-tert-butylphosphinomethyl)benzene

The preparation of this ligand was carried out in the manner disclosed in WO 99/47528 in accordance with Example 18.

Example 8 (comparative)

Preparation of 1,3 bis(diadamantylphosphino) propane

Preparation   of   1,3-bis-(di-1-adamantylphosphino)propane (2)

8.1 Preparation of (1-Ad)$_2$PLi

Bu^{n}Li (2.5 M in hexanes, 42.02 cm^3, 105.1 mmol) was added dropwise via syringe to a stirred solution of Ad$_2$PH (10.59 g, 35.0 mmol) in THF (150 cm^3). This resulted in a darkening of the solution to yellow and the precipitation of a large quantity of yellow solid, in a mildly

exothermic reaction. The reaction was stirred at ambient temperature for 3 h. The volatiles were removed *in-vacuo*, affording a very pale orange solid. The solid was washed with pentane (2 × 50 cm^3) to remove excess Bu^{n}Li, resulting

5 in the isolation of a white powder (washings orange) which was dried *in-vacuo*. The yield for this step was assumed to be quantitative, on the basis of previous NMR experiments.

8.2 Reaction of 1,3-dibromopropane with 2 equiv (1-Ad)$_2$PLi

10 1,3-dibromopropane (degassed, 1.78 cm^3, 17.5 mmol) was added dropwise via syringe to a stirred suspension of Ad$_2$PLi (35.0 mmol, prepared as above) in THF (150 cm^3). Initially a yellow solution was formed, then a great deal of white solid crashed out (product). The volatiles were

15 removed *in-vacuo* and dichloromethane (300 cm^3) added via cannula affording a turbid solution. The turbidity was lost on addition of water (degassed, 100 cm^3), a two phase system being formed. The lower phase was removed via cannula filtration. The volatiles were removed *in-vacuo*,

20 affording a white powder, which was washed with pentane (100 cm^3), dried and isolated in the glovebox. Yield 6.45 g, 57 %. ^{31}P NMR: δ = 24 ppm, 95+ % pure. FW = 644.94.

Example 9

25 Preparation of 1,2-bis-(dimethylaminomethyl)ferrocene

n-Butyllithium (Aldrich, 2.5 molar in hexane, 24 ml, 54 mmol) is added to a solution of (dimethylaminomethyl)ferrocene (Aldrich, 13.13 g, 10.69

30 ml, 48.97 mmol) in diethyl ether (80 ml) under nitrogen at a temperature of 25°C and the reaction mixture stirred for 4 hours. The resulting red solution is then cooled to approximately −70°C in a dry ice/acetone bath and

Eschenmosers salt (ICH₂NMe₂) (Aldrich, 10 g, 54 mmol) is added. The reaction is allowed to warm to room temperature and stirred overnight.

5   The resultant solution is quenched with excess aqueous sodium hydroxide and the resulting product extracted with diethyl ether (3 x 80 ml) dried over anhydrous magnesium sulfate, filtered over celite, and volatiles removed *in vacuo* to yield the crude title compound as a light orange
10 crystalline solid. The crude product is recrystallised from light petrol with cooling to −17°C and the recrystallised product washed with cold petrol to yield the title compound as a light orange solid (13.2 g, 74%). The compound can be further purified by sublimation to
15 give 8.5 g (52%) of the title compound (mpt 74°C).

^{1}H NMR(250 MHz; CDCl₃):δ4.23(brd, 2H); 4.11-4.10(t, 1H); 4.04(s, 5H); 3.43, 3.38, 3.23, 3.18 (AB quartet, 2H); 2.22(s, 6H).

20
^{13}C NMR (63 MHz; CDCl₃):δ83.81; 70.40; 69.25; 66.84; 57.35; 45.23.

20   Calculated: C:66.93%; H:9.63 %

Example 11
Preparation   of   1-hydroxymethyl-2-dimethylaminomethyl ferrocene

25

n-Butyl lithium (Aldrich, 1.6 molar in diethyl ether, 5.14 ml, 8.24 mmol) is added to a solution of 1-dimethylaminomethyl ferrocene (Aldrich, 1.0g, 4.12mmol) in diethyl ether (20mL) under argon. The reaction is stirred

30 for 3 hours and develops a reddish colour. The solution is then cooled in a dry ice/acetone bath, calcined para-formaldehyde (0.247g, 2 times excess) added and the resultant mixture stirred overnight at room temperature.

The reaction is then quenched with water, extracted with diethyl ether, dried over $MgSO_4$, and filtered over celite. The solvent is removed *in vacuo* to yield crude title compound. The crude product is applied to a neutral

5   alumina column, which is eluted with petrol/diethyl ether (9:1 ratio) to remove the starting material, 1-dimethylaminomethyl ferrocene. The column is then eluted with substantially pure ethyl acetate to elute the title compound. The ethyl acetate is removed *in vacuo*, to yield

10   the title compound as an orange oil/crystalline mass.

^{1}H NMR (250 MHz; $CDCl_3$) δ2.131 (s, 6 H), δ2.735 (d, 1 H, 12.512 Hz), δ3.853 (d, 1 H, 12.512 Hz), δ3.984 (dd, 1 H, 2.156 Hz), δ4.035 (s, 5 H), δ4.060 (dd, 1 H, 2.136 Hz)

15   δ4.071 (d, 1 H, 12.207 Hz), δ4.154 (m, 1 H), δ4.73 (d, 1 H, 12.207 Hz).

Example 12

Preparation of 1,2-bis-(ditertbutylphosphinomethyl)ferrocene

Di-tertbutylphosphine (Aldrich, 0.54 ml, 2.93 mmol) is
5   added to a solution of 1-hydroxymethyl-2-
dimethylaminomethyl ferrocene (Example 11, 0.2 g, 0.753
mmol) in anhydrous acetic acid (15 ml) and acetic
anhydride (0.753 mmol) under argon and the resulting
mixture is stirred at 80°C for 72 hours. The anhydrous
10 acetic acid is removed *in vacuo* at approximately 70°C to
yield the crude title product as an orange/yellow solid.
The crude product is recrystallised from ethanol with
cooling to -17°C, filtered and the filtrate washed with
cold ethanol to yield the title compound as an orange
15 solid (0.23 g)

Example 13

Preparation of 1-hydroxymethyl-2,3-bis-
(dimethylaminomethyl)ferrocene

5   To a stirred solution of 1,2-bis-(dimethylaminomethyl)
     ferrocene (Example 9, 0.70g, 2.32 mmol) in diethyl ether
     (15 cm^3) under argon is added 1.2 equivalents n-butyl
     lithium (Aldrich, 1.75mL, 1.6M in diethyl ether) and the
     mixture stirred for three hours to yield a red solution.
10   The reaction mixture is cooled in a dry ice/acetone bath,
     calcined paraformaldehyde added in 2:1 excess, and the
     resultant mixture stirred at room temperature overnight.
     The mixture is quenched with water and extracted with
     diethyl ether. The ethereal extracts are dried over MgSO$_4$,
15   filtered over celite and the solvent removed in vacuo, to
     yield the title compound (0.7g, 2.12 mmol, 91%) as an
     orange oil., which partially crystallized on cooling.

     ^{1}H NMR (250 MHz; CDCl$_3$) δ 2.133 (s, 6 H), δ 2.171 (s, 6 H),

Example 14
Preparation of
10   1,2,3-tris-(ditertbutylphosphinomethyl)ferrocene

Di-tert-butylphosphine (Aldrich, 2.60 mL, 13.98 mmol) and acetic anhydride (0.24 mL, 2.33 mmol) is added to a solution   of   1-hydroxymethyl-2,3-bis-
15   (dimethylaminomethyl)ferrocene (Example 13, 0.70g, 2.12 mmol) in acetic acid (freshly distilled from acetic anhydride 25 cm^3), under argon. The solution is then stirred at 80°C for 7 days, during which time the solution becomes a dark orange colour. The solvent is then removed
20   in vacuo and recrystallisation effected from refluxing ethanol together with cooling to -17°C overnight to yield the title compound (0.43 g, 0.7 mmol, 31%) as a yellow/orange powder.

25   ^{1}H NMR (250 MHz, CDCl$_3$) δ 1.12 (dd - pseudo triplet, 36 H, 12.1 Hz), δ1.26 (d, 18H, 10.7 Hz), δ2.68 (d, 2 H, 17.7 Hz), δ2.95 (s, 2 H), δ3.07, (m, 2 H), δ4.01 (s, 5 H) δ 4.33 (s, 2 H)

Example 15

Preparation   of   1,2-bis-(dicyclohexylphosphinomethyl)
ferrocene

5   The title compound was prepared in accordance with the
procedure of Example 10 employing dicyclohexylphosphine
(Strem of 48 High Street Orwell, Royston, United Kingdom
SG8   5QW,   659   mg,   3.33   mmol),   1,2-
bis(dimethylaminomethyl)ferrocene (0.5 g, 1.66 mmol) and
10   anhydrous acetic acid (100 ml). Yield 0.421 g.

Example 16

Preparation   of   1,2-bis-(di-iso-butylphosphinomethyl)
ferrocene

15

The title compound was prepared in accordance with the
procedure of Example 10 employing di-iso-butylphosphine
(Strem   486   mg,   3.33   mmol),   1,2-
bis(dimethylaminomethyl)ferrocene (0.5 g, 1.66 mmol) and
20   anhydrous acetic acid (100 ml). Yield 0.372 g.

Example 17

Preparation   of   1,2-bis-(dicyclopentylphosphinomethyl)
ferrocene

25

The title compound was prepared in accordance with the
procedure of Example 10 employing dicyclopentylphosphine
(Strem   566   mg,   3.33   mmol),   1,2-
bis(dimethylaminomethyl)ferrocene (0.5 g, 1.66 mmol) and
30   anhydrous acetic acid (100 ml). Yield 0.432 g.

Example 18
Preparation of 1,2-bis-(diethylphosphinomethyl) ferrocene

The title compound was prepared in accordance with the
5   procedure of Example 10 employing diethylphosphine (Strem
299 mg, 3.33 mmol), 1,2-bis(dimethylaminomethyl)ferrocene
(0.5 g, 1.66 mmol) and anhydrous acetic acid (100 ml).
Yield 0.254 g.

10 Example 19
Preparation   of   1,2-bis(di-isopropylphosphinomethyl)
ferrocene

The title compound was prepared in accordance with the
15 procedure of Example 10 employing di-iso-propylphosphine
(Digital Speciality Chemicals 392 mg, 3.33 mmol), 1,2-
bis(dimethylaminomethyl)ferrocene (0.5 g, 1.66 mmol) and
anhydrous acetic acid (100 ml). Yield 0.262 g.

20 Example 20
Preparation of 1,2-bis-(dimethylphosphinomethyl)ferrocene

The title compound was prepared in accordance with the
procedure of Example 10 employing dimethylphosphine
25 (Digital Speciality Chemicals, 206 mg, 3.33 mmol), 1,2-
bis(dimethylaminomethyl)ferrocene (0.5 g, 1.66 mmol) and
anhydrous acetic acid (100 ml). Yield 0.285 g.

Example 21
30 Preparation of 1,2-bis-(diadamantylphosphinomethyl)ferrocene-
bis-methanesulphonate

Di-adamantylphosphine (prepared according to J.R.Goerlich, R.Schmutzler; Phosphorus Sulphur and Silicon; 1995, 102, 211-215, 20.0g, 0.066 mol) was added to a solution of 1,2-bis(dimethylaminomethyl)ferrocene (Example 9, 10 g, 0.033 mol) in anhydrous acetic acid (100 ml) under nitrogen and the resulting mixture is stirred at 80°C for 72 hours. The orange yellow precipitate which forms is filtered and dried *in vacuo* at approximately 70°C to yield the title compound as an orange/yellow solid. The title compound is insoluble in a range of organic solvents and it is therefore purified by conversion to the bis-methanesulphonate salt by addition of excess methanesulphonic acid to a methanol slurry of the crude product. This resulted in complete dissolution of the product salt which was then isolated by removal of the methanol *in vacuo* followed by washing with ether and drying to give the title compound as a pale yellow solid (14.0g, 54%).

^{1}H NMR (250 MHz; CD$_3$CN): δ4.57 (2H, d, J = 2Hz); 4.35 (5H, s); 4.27 (1H, t, 2Hz); 3.34 (4H, br); 2.6 (6H, br,); 2.35-2.18 (18H br); 2.16-2.0 (18H, br); 1.92-1.72 (24H, br).

^{31}P NMR (101 MHz; CD$_3$CN): δ26.58 ppm.

Elemental analysis: Found: C:64.15%; H:7.88% Calculated: C:64.29%; H:7.94%

Example 22

Preparation of 1,2 bis(di-1-adamantylphosphinomethyl) ferrocene-bis-methane sulphonate

The preparation of this ligand was carried out as follows:

22.1   Preparation of (1-Ad)$_2$P(O)Cl

The di-1-adamantyl phosphine chloride was prepared in accordance with the method of Example 1.1.

22.2   Preparation of (1-Ad)$_2$PH

The di-1-adamantyl phosphine was prepared in accordance with the method of Example 1.2.

22.3   Preparation of 1,2-bis(di-1-adamantylphosphinomethyl) ferrocene-bis-methanesulphonate

The title compound was prepared in accordance with the procedure exemplified in Example 21.

Example 23
Preparation of 1,2-bis(di-1-(3,5-dimethyladamantyl) phosphinomethyl) ferrocene-bis-methanesulphonate

23.1   Di-1-(3,5-dimethyladamantyl) phosphinic chloride
was prepared in accordance with the method of Example 3.1.

23.2   Di-1-(3,5-dimethyladamantyl) phosphine
was prepared in accordance with the method of Example 3.2.

23.3   1,2-bis-(di-1-(3,5-dimethyl-adamantylphosphinomethyl) ferrocene-bis-methanesulphonate

The title compound was prepared in accordance with the procedure exemplified in Example 21 except using di-1-

2(3,5-dimethyl-adamantyl)phosphine (23.69 g, 0.066 mol) instead of di-adamantylphosphine. Yield 15 g.

Example 24

Preparation of 1,2-bis(di-1-(5-tert-butyl-adamantyl) phosphinomethyl)ferrocene-bis-methanesulphonate

24.1   Di-1-(5-tert-butyladamantyl) phosphinic chloride
was prepared as per Example 4.1 above.

24.2   Di-1-(5-tert-butyladamantyl) phosphine
was prepared as per Example 4.2 above.

24.3   1,2-bis(di-1-(4-tert-butyl-adamantyl) phosphinomethyl) ferrocene-bis-methanesulphonate

The title compound was prepared in accordance with the procedure exemplified in Example 21 except using di-1-(4-tert-butyladamantyl)phosphine (27.39 g, 0.066 mol) instead of di-adamantyl phosphine. Yield 14.52 g.

Example 25
Preparation of 1,2-bis-(1-adamantyl tert-butyl-phosphinomethyl)ferrocene-bis-methanesulphonate

25.1   1-adamantylphosphonic acid dichloride

This compound was synthesised according to the method of Olah et al (J. Org. Chem. 1990, 55, 1224-1227).

25.2   1-adamantyl phosphine

LiAlH$_4$ (3.5 g, 74 mmol) was added over 2 hours to a cooled solution (0°C) of 1-adamantylphosphonic acid dichloride (15 g, 59 mmol) in THF (250 cm^3). The reaction was then allowed to warm to ambient temperature and was stirred for
5   20 hours. The grey suspension was then cooled (0°C) and HCl (75 cm^3, 1M) was slowly added via syringe, to afford a two phase system with some solid present in the lower phase. Concentrated HCl (8 cm^3, 11M) was then added to improve the separation of the two layers. The (upper) THF
10   phase was removed via cannula and dried over magnesium sulphate. After filtration via cannula, the volatiles were removed *in-vacuo* to afford the product.

25.3   1-adamantyl tert-butyl phosphine

15

nBuLi (20 cm^3, 32 mmol 1.6M soln) was added over 1 hour to a cooled solution of 1-adamantyl phosphine (5.0 g, 30 mmol) in THF (100 cm^3). The solution was allowed to warm to room temperature and stirred for a further 2 hours. The
20   solution was recooled to 0°C and tert-butylchloride (2.78 g, 30 mmol) was added and stirring continued for a further 16 hours at room temperature. The reaction mixture was quenched with water and the aqueous phase extracted with dichloromethane (2 x 50 ml). The organic phase was dried
25   over sodium sulphate and evaporated *in-vacuo* to yield the title compound.

25.4   1,2-bis-(-1-adamantyl   tert-butyl-phosphinomethyl)
ferrocene-bis-methanesulphonate

30

The title compound was prepared in accordance with the procedure exemplified in Example 21 except using 1-

adamantyl tert-butyl phosphine (14.78 g, 0.066 mol) instead of di-adamantyl phosphine. Yield 9.80 g.

Example 26

Preparation of 1,2-bis-(di-1-diamantylphosphinomethyl) ferrocene-bis-methanesulphonate

26.1   Diamantane

This was synthesised according to the method of Tamara et al. Organic Syntheses, CV 6, 378.

26.2   Di-1-(diamantane) phosphinic chloride

Prepared as per Di-1-adamantyl phosphinic chloride of Example 1.1 except using diamantane 20.0 g (0.106 mol) and AlCl$_3$ (16.0 g, 0.12 mol). Yield 25.5 g FW: 456.5.. ^{31}P NMR: δ: 87 ppm (s).

26.3   Di-1-(diamantane) phosphine

Prepared as per Di-1-adamantyl phosphine of Example 1.2 except using 25.0 g Di-1-(diamantane) phosphinic chloride. Yield 14.0 g FW: 406.. ^{31}P NMR: δ: 16.5 ppm (s).

26.4   1,2-bis-(di-1-diamantylphosphinomethyl)ferrocene-bis-methanesulphonate

The title compound was prepared in accordance with the procedure exemplified in Example 21 except using di-1-diamantane phosphine (26.79 g, 0.066 mol) instead of di-adamantyl phosphine. Yield 12.5 g.

Example 27

Preparation   of   1,2-bis-(di-(1,3,5,7-tetramethyl-6,9,10-
trioxa-2-phospha-adamantylmethyl))ferrocene

5   1,3,5,7-tetramethyl-2,4,8-trioxa-6-phospha-adamantane
     (obtained from Cytec, 14.0g, 0.066 mol) was added to a
     solution of 1,2-bis(dimethylaminomethyl)ferrocene (Example
     9, 10 g, 0.033 mol) in anhydrous acetic acid (100 ml)
     under nitrogen and the resulting mixture is stirred at
10   80°C for 72 hours. The anhydrous acetic acid is removed *in
     vacuo* at approximately 70°C to yield the crude title
     product as an orange/yellow solid. This is washed with
     hot methanol to give the product as a mixture of isomers
     as an orange solid. (12.0 g, 58%).

15

     ^{1}H NMR (250 MHz; CDCl$_3$): δ4.25-3.95 (8H, br, m); 3.46 (4H,
     br); 1.57-2.0 (8H, br, m); 1.43-1.23 (24H, br m).

     ^{31}P NMR (101 MHz; CDCl$_3$): δ -27.41 (br), -29.01 (s), -33.9
20   (br) ppm.

     Elemental analysis: Found: C:57.80%; H:7.35% Calculated:
     C:57.87%; H:7.40%

25   Example 28

Preparation of 1,2-bis-(dimethylaminomethyl)ferrocene-bis
methyl iodide

     Methyl iodide (23.28g, 0.164 mol) is added to a solution
30   of 1,2-bis-(dimethylaminomethyl)ferrocence (Example 9,
     20g, 0.082 mol) in degassed methanol (100 ml), and the
     mixture stirred at room temperature under a nitrogen
     atmosphere for 24 hours. The resulting precipitate is

removed by filtration, washed with ether and dried to yield the title compound (43.0g).

Elemental analysis: Found: C:36.8%; H:5.1%; N,4.8%

5   Calculated: C:37.0%; H:5.2%; N,4.8%

^{13}C NMR   (D_2O): δ53.27, δ53.21, δ53.15, δ64.68, δ71.77, δ73.24, δ74.13, δ74.95

10   Example 29

Preparation of 1,2-bis(dihydroxymethylphosphinomethyl) ferrocene

Potassium hydroxide (8.52g, 0.152 mol) is added to a
15   solution of tetrakis(hydroxymethyl) phosphonium chloride (Aldrich, 38.54g of 80% w/w aqueous solution, 0.162 mol) in degassed methanol (40 ml), and stirred at room temperature under a nitrogen atmosphere for 1 hour. The resultant mixture is added dropwise to a degassed solution
20   of   1,2-bis-(dimethylaminomethyl)ferrocene-bis-methyl iodide (Example 28, 19.98g, 52.2 mmol) in methanol (40 ml) under nitrogen at room temperature with stirring. The resultant mixture is refluxed under nitrogen for 20 hours, and the solvent removed in vacuo to form a red
25   precipitate. Water (30 ml), diethyl ether (85 ml) and triethylamine (35 ml) is added to the precipitate and the solution stirred at room temperature for 1 hour. The aqueous layer is removed and re-extracted with diethyl ether (2 x 30 ml). The combined ethereal extracts are
30   washed with water (3 x 20 ml) dried over sodium sulphate and filtered. The ether is removed in vacuo to yield the crude title compound (14.33g, 94% yield) as a microcrystalline orange solid. The crude product is

recrystallised from a warm dicholormethane/methanol solution with the addition of light petroleum and cooling to yield the title compound (10.69g, 70% yield) as yello-orange crystals.

Elemental analysis: Found: C:48.44%; H:4.12%; N,0.0%

Example 32

Preparation   of   1,2-bis-(di-1,3,5,7-tetramethyl-6,9,10-
trioxa-2-phospha-adamantylmethyl))benzene

The preparation of this ligand was carried out in the
manner disclosed in WO-A-03/070370 in accordance with
Example 4 therein.

Example 33

Preparation of methyl propanoate from ethylene, carbon
monoxide and methanol catalysed by a compound of the
present invention

Condition 1 ratio of ligand:palladium = 5.2:1, ratio of
acid:palladium = 160:1 and ratio acid:ligand = 30:1

Condition 2 ratio of ligand:palladium = 5.2:1, ratio of
acid:palladium = 480:1 and ratio acid:ligand = 90:1

A mechanically stirred autoclave (Hastelloy) of 2 litre
capacity was evacuated of air and then charged with a
solution of tri(dibenzylideneacetone)dipalladium (1.44 x
10^{-5} moles),   1,2-bis-(di-tertbutylphosphinomethyl)
ferrocene of Example 10, (7.61 x 10^{-5} moles) and methane
sulfonic acid (2.30 x 10^{-3} moles condition 1, 6.90 x 10^{-3}
moles condition 2) in 300 ml of methyl propanoate/methanol
(70 wt% methyl propanoate). The autoclave was heated to
100°C and when at that temperature, ethylene (8 x $10^{5} Nm^{-2}$)
was added on top of the vapour pressure of the solvents
and immediately an equimolar mixture of carbon monoxide

and ethylene ($2 \times 10^5 Nm^{-2}$) added to the system through a
pressure regulating valve set to $10 \times 10^5 Nm^{-2}$ above the
solvent vapour pressure. Suitably, the molar ratio of
ethylene to carbon monoxide in the reactor is

5   approximately 9:1. The temperature of the reactor was
maintained at 100°C and as the reaction proceeded
additional carbon monoxide and ethylene was added (on an
equimolar basis) through the pressure regulating Tescom
valve. No catalyst precipitation was observed.

10

Initial reaction rates measured in moles of methyl
propanoate (MeP) per mole of palladium per hour and
turnover measured in moles of methyl propanoate per mole
of palladium were determined for the catalyst. This may be

15   accomplished by an analysis of the amount of gas consumed
per unit time (rate) and the total amount of gas consumed
during the reaction, assuming ideal gas behaviour and 100%
selectivity to methyl propanoate.

20   Table 1 shows the effect in increasing the relative acid
concentration compared to phosphine ligand concentration
(and metal concentration) for a batch process on both the
maximum initial rate and the turnover number (TON) after 1
hour, wherein initial reaction rates are measured in moles

25   of methyl propanoate (MeP) per mole of palladium per hour
and TON is measured as moles of methyl propanoate per mole
of palladium. For both TON and maximum initial rate,
values are significantly increased passing from condition
1 to condition 2, i.e. when increasing both the

30   acid:palladium and acid:ligand ratios at constant
ligand:palladium values.

Example 34

Pd(OAc)$_2$(22mg,0.1mmol) and the respective phosphine ligand (0.5mmol) were weighed out in the inert atmosphere glove box into 500mL 3-neck round bottom flasks. On removal,

5   300mL of degassed MeOH were added and the mixture stirred for 1 hour. To the solution methanesulphonic acid (640µl, 10mmol) was added. The weight of the catalyst solution was taken. The autoclave was charged with the solution and heated to 100C with stirring (3.0 barg vapour pressure).

10   The reaction was started by the introduction of CO/ethylene (1:1) gaseous mixture to the autoclave. The total pressure of the autoclave was controlled by a TESCOM (9.8 barg). This resulted in a 9:1 ratio of ethylene to CO. The temperature and pressure were maintained 3 hours

15   during which period these values were recorded.

The gases were isolated and the unit cooled to room temperature. The depressurised unit was emptied and the final weight of the solution taken.

5[a]	5	82.53	1 : 6 : 4

a) run at 3 x palladium concentration {67.3 mg Pd(OAc)$_2$}

For the ligand 1,3-bis(di-tert-butylphosphino)2-methylene-propane (ligand 5) additional ligand with or without excess acid results in a drop in catalyst performance. The optimum conditions of low ligand and acid, e.g. Run Nos. 3 and 4, result in the highest catalyst productivity under the conditions studied. Addition of excess ligand at high acid ratio as in Run No. 1 results in a significant drop in performance, as does addition of excess ligand at low acid ratios.

The following two tables contain data for the ligand 1,2-Bis(di-tert-butylphosphinomethyl)benzene. The data was collected at 80C hence the rates and turnover numbers are lower than the data we have already included. However, the data shows that at constant acid:ligand[b] levels, an increase in ligand:Pd ratio provides large increases in initial rate and TON values. This data also used the preformed catalyst [(L-L)Pd(dba) (for details see below) and adds the ligand excess as the protonated salt. The experimental detail is provided below.

<u>Table 7</u>

Ligand	Ratio Pd:Lig:Acid	Ratio Acid:Ligand[b]	Initial rate	TON after 4 hours
1	1:5:36	10.9	5000	12000
1	1:5:72	20	17000	25000
1	1:5:143	37	22000	30000

[b] in this ratio the "acid" includes both the acid from the protonated phosphine ligand together with the additional

acid added (i.e., "free" acid) and the ligand is simply the protonated phosphine ligand.

Table 8

Ligand	Ratio Pd:Lig:Acid	Ratio Acid:Ligand[b]	Initial rate	TON after 4 hours
1	1:10:90	10.9	22000	42000
1	1:10:182	20	33000	52000
1	1:10:352	37	41500	71000

The number of moles of palladium is equal to the number of moles of $L_2Pd(dba)$.

The work described in these examples was carried out in 2L capacity autoclaves. In each test 10mg of $L_2Pd(dba)$ catalyst and 32mg (4 equivalents) or 72mg (9 equivalents) of protonated phosphine were added to the preparation flask in a nitrogen purged glove box. 175mL of azeotrope product consisting of 50:50 wt% methanol and methyl propanoate and 125mL of methyl propanoate were then degassed and added to the flask to provide a reaction solution which was close to 70wt% methyl propanoate. After addition of the required quantity of methanesulphonic acid the solution was transferred to the evacuated autoclave and heated to 80°C in vacuo. During this period and at all subsequent times the autoclave was stirred at ~1000 r.p.m. When this temperature had been reached the total pressure of the system was increased to 9 bar (from the vapour pressure baseline of ~1 bar) by the addition of ethylene and then topped up with 2bar of 1:1

C_2H_4/CO such that the total pressure was ~11bar and the headspace C_2H_4/CO ratio was 9:1. After this time only the 1:1 gas was fed to the system at the rate which was required to hold the pressure within the system constant. Reaction rates and catalyst TONs were calculated from the rate of removal of gas from the feed reservoir assuming ideal gas behaviour and 100% selectivity for methyl propanoate formation.

Preparation   of   1,2-bis(di-1-adamantylphosphinomethyl)benzene palladium (dba)

THF (100 cm^3) was added to a combination of ligand (2.05 g, 2.90 mmol) and palladium dba (1.61 g, 2.90 mmol [Pd]) affording a deep red-orange turbid solution. The reaction was stirred for 3 h. The reaction was filtered via cannula, yielding a deep red-orange filtrate and a small quantity of [Pd] residue. The volatiles were removed *in-vacuo* affording a deep red powdery solid. Pentane (50 cm^3) was added via cannula and attrition performed with a spatula, resulting in an orange powder separating out. The amber pentane washings were removed via cannula filtration, and the solid washed with Et$_2$O at −10 °C (3 × 50 cm^3). The resultant orange powder was dried *in-vacuo* and isolated in the glovebox. Yield 2.68 g, 88 %. ^{31}P NMR: δ = 46, 42 ppm (1:1 ratio), essentially phosphorus pure. FW = 1047.73.

Preparation   of   1,3-bis-(di-1-adamantylphosphino)propane palladium (dba)

As above, except using ligand (1.96 g, 3.04 mmol) and palladium dba (1.69 g, 3.04 mmol [Pd]) in THF (70 cm³). After 3 h, the deep red-orange solution was fairly turbid in appearance; an additional 50 cm³ THF was added to

5   further dissolve the product. The reaction was worked-up as above, except the Et_2O washing was performed at ambient temperature. The solid was isolated in the glovebox as an orange powder. Yield 2.08 g, 69 %. ^{31}P NMR: δ = 42, 38 ppm (1:1 ratio, noisy). FW = 985.66.

15

Example 35

Preparation of methyl propanoate from ethylene, carbon monoxide and methanol catalysed by a compound of the present invention

20

The continuous process exemplified involved the reaction of purified streams of carbon monoxide, ethylene and methanol in the liquid phase, in the presence of a catalyst system, to generate the desired product, methyl

25 propanoate.

The reaction was carried out at 100°C and at 12 barg pressure in the reactor vessel.

30 The catalyst system was made up of three components, being a palladium salt, a phosphine ligand and an acid. The three catalyst components, when combined together and dissolved in the reaction mixture, constitute the reaction

catalyst or catalyst system, a homogeneous catalyst, which converted dissolved reactants to the product methyl propanoate in the liquid phase.

5   During continuous operation, the catalyst decomposed at a slow but steady rate, and was replaced by adding fresh catalyst, or the rate of generation of the product, methyl propanoate reduces.

10   The reactor vessel was fitted with an agitator, and also a means of re-circulating the unreacted gas that collected in the upper headspace area of the reactor. The unreacted gas from the reactor vessel headspace, which was made up of a mixture of ethylene and carbon monoxide, was returned

15   continuously to the reactor via an entry pipe at the base, such that the gas passed up through the reaction mixture continuously.

Upon entering into the reactor vessel the gas was

20   dispersed by the agitator into fine bubbles. In this way the ethylene and carbon monoxide were dissolved in the reaction mix.

Fresh ethylene and carbon monoxide gases were added to the

25   re-circulating gas to make up for the amount of the two gases that have been used up by the reaction. Fresh methanol was also added continuously to the reactor vessel, in order to replace the methanol that has been used up in the reaction.

30

The reactor vessel held the bulk liquid reaction mixture, along with the three components of the homogeneous

catalyst, being a palladium salt, a phhosphine ligand, and a sulphonic acid.

In order to recover the product methyl propanoate, a stream of reaction mixture was passed continuously out of the reactor and into the distillation column.

The distillation column, being a single stage 'flash' type distillation column, provided a means of separating a fraction of the methyl propanoate and methanol components of the reaction mixture from the non-volatile dissolved catalyst components. This was achieved by vaporising a fraction of the reaction mixture as it passed through the flash column. The part of the reaction mixture which remained as liquid after passing through the flash column, and which still contained useful catalyst components, was returned to the reactor vessel so that the catalyst components could take part in the on-going reaction.

If the methyl propanoate product was required free of methanol, a second distillation column was required. In this case, the vapour stream from the flash column, which is a mixture of methyl propanoate and methanol was passed into the second distillation column, where the pure methyl propanoate was generated as the heavier product, and taken off from the base of the column. A low boiling mixture of methanol and methyl propanoate was generated as the light product, and was removed continuously from the top of the MeP purification column. In order to utilise the methanol as efficiently as possible in the process, the low boiling mixture of methanol and methyl propanoate was returned continuously to the reactor vessel.

After start up of the continuous reactor unit, when the desired rate of generation of methyl propanoate had been achieved, a process of gradual reduction of the feed rates of the catalyst components was undertaken.

In order to sustain the rate of generation of methyl propanoate it was necessary to continuously replace the palladium catalyst component which was lost to decomposition with fresh palladium at a rate which balanced the rate of loss.

This led to the situation where the standing concentrations of catalyst components became constant for a given rate of generation of methyl propanoate, and just able to sustain flow sheet reaction rate, as indicated by constant concentrations of carbon monoxide and ethylene in the headspace area of the reactor vessel. This was called the balance point, because under these conditions the rate of palladium decomposition was balanced exactly by the rate of addition of fresh palladium.

From the rate of addition of fresh palladium catalyst component under balance point conditions, the palladium turnover number (TON) was calculated. This is defined as the number of mol of methyl propanoate generated per hour, for each mol of palladium consumed by the decomposition process per hour.

Upon reaching a steady rate at a pre-determined set of control conditions, the instantaneous values of all of the variables were recorded, and used as representative data to show the performance of the process under the conditions in use at the time.

To gather data on the effect of levels of phosphine ligand and acid present in the reaction mixture on palladium turnover number, all variables were held constant except

5   the background levels of ligand and acid in the reaction mixture.   These levels were changed by making small additions of these compounds to the reaction vessel via a dedicated tank and pumping system.   The additions were then followed by careful adjustment of the catalyst

10   solution feed rate to re-establish the balance position.

The experimental design was such that after collecting each new set of balance point data, the system was returned to a previous set of conditions to check for any

15   drifting of performance before moving on to the next set of experimental conditions.

In this way, comparative sets of results were drawn up which showed clearly the changes to catalyst stability

20   that were caused by the variations in the background levels of phosphine ligand and acid levels.

The amount of palladium in the feed to the reactor is critical to calculation of turnover number results.

25   Assurance on the rate of fresh catalyst being fed to the system was provided by analysis of each batch of catalyst prior to transfer to the catalyst feed tanks for palladium content.   Further assurance was gained by determination of the actual feed rate of catalyst from timing of the fall

30   in the level in a burette, which is part of the catalyst feed system.

Table 9 shows the effect on palladium turnover number
(TON) when increasing the acid:ligand ratio and the
ligand:metal ratio.

5   In this Example, the acid used was methanesulphonic acid,
the   bidentate   phosphine   ligand   was   1,2-bis-
(ditertbutylphosphinomethyl)benzene,   and   the   palladium
compound was tri(dibenzylideneacetone)dipalladium.

10   Table 9

ligand:Pd mol ratio	acid:ligand mol ratio	Free acid in reactor (ppm)	Turnover Number (moles MeP/moles Pd)
6.29	9.93	676	2.02×10^6
10.33	13.38	988	3.30×10^6
13.49	21.73	1682	3.41×10^6
17.16	34.65	2834	3.42×10^6
17.16	7.40	837	5.00×10^6

Further trends are seen in Figures 1-3 of the accompanying
figures.

15

Figure 1 shows TON versus acid:ligand mol ratio. Clearly,
as the acid:ligand ratio increases above about 10, there
is a large increase in TON for this particular catalyst
system.

20

Figure 2 shows TON versus amount of methanesulphonic acid
present free in the reactor.   Clearly, as the level of
acid increases, there is a large increase in TON for this
particular catalyst system.

25

Figure 3 shows Pd amount in solution versus amount of
methanesulphonic acid. Clearly, as the level of acid
increases, there is a decrease in the amount of Pd in
solution for this particular catalyst system, whilst the
5   reaction rate remains constant. Therefore, working at
these elevated acid levels, reaction rates can be
maintained even as the palladium levels decrease. The
advantages in view of the relative cost of the palladium
component of the catalyst system is clear.
10

Although some preferred embodiments have been shown and
described, it will be appreciated by those skilled in the
art that various changes and modifications might be made
without departing from the scope of the present invention,
15   as defined in the appended claims.

Attention is directed to all papers and documents which
are filed concurrently with or previous to this
specification in connection with this application and
20   which are open to public inspection with this
specification, and the contents of all such papers and
documents are incorporated herein by reference.

All of the features disclosed in this specification
25   (including any accompanying claims, abstract and
drawings), and/or all of the steps of any method or
process so disclosed, may be combined in any combination,
except combinations where at least some of such features
and/or steps are mutually exclusive.
30

Each feature disclosed in this specification (including
any accompanying claims, abstract and drawings) may be
replaced by alternative features serving the same,

equivalent or similar purpose, unless expressly stated otherwise. Thus, unless expressly stated otherwise, each feature disclosed is one example only of a generic series of equivalent or similar features.

5

The invention is not restricted to the details of the foregoing embodiment(s). The invention extends to any novel one, or any novel combination, of the features disclosed in this specification (including any

10 accompanying claims, abstract and drawings), or to any novel one, or any novel combination, of the steps of any method or process so disclosed.
